Brief contents

Diseases and medically relevant topics xxv

Abbreviations xxvii

Part 1 Basic concepts of life

1 The basic molecular themes of life 3
2 Cells and viruses 16
3 Energy considerations in biochemistry 27

Part 2 Structure and function of proteins and membranes

4 The structure of proteins 45
5 Methods in protein investigation 71
6 Enzymes 87
7 The cell membrane and membrane proteins 101
8 Muscle contraction, the cytoskeleton, and molecular motors 125

Part 3 Metabolism

9 Food digestion, absorption, distribution to the tissues, and appetite control 145
10 Mechanisms of transport, storage, and mobilization of dietary components 162
11 Principles of energy release from food 177
12 Glycolysis, the citric acid cycle, and the electron transport system 188
13 Energy release from fat 216
14 Synthesis of fat and related compounds 223
15 Synthesis of glucose (gluconeogenesis) 236
16 Strategies for metabolic control and their application to carbohydrate and fat metabolism 243
17 Why should there be an alternative pathway of glucose oxidation? The pentose phosphate pathway 267
18 Raising electrons of water back up the energy scale – photosynthesis 272
19 Amino acid metabolism 282
20 Nucleotide synthesis and metabolism 298

Part 4 Information storage and utilization

21 The genome 313
22 DNA synthesis, repair, and recombination 332
23 Gene transcription and control 353
24 Protein synthesis and controlled protein breakdown 380
25 The RNA world – RNA microgenes and RNA interference 405
26 Protein sorting and delivery 411
27 Cell signalling 429
28 Manipulating DNA and genes 458

Part 5 Molecular biology in health and disease

29 Special topics: blood clotting, xenobiotic metabolism, reactive oxygen species 483
30 The immune system 493
31 The cell cycle and its control 507
32 Apoptosis 512
33 Cancer 517

Abbreviations xxvii

Part 1 Basic concepts of life

Chapter 1 The basic molecular themes of life 3

All life forms are similar at the molecular level 3

The energy cycle in life 4

The laws of thermodynamics deal with energy 4

Energy can be transformed from one state to another 5

ATP is the universal energy currency in life 5

Types of molecules found in living cells 6

- Small molecules 7
- Macromolecules are made by polymerization of smaller units 7
- Protein and nucleic acid molecules have information content 7

Proteins 8

- Catalysis of reactions by enzyme proteins is central to the existence of life 8
- Why are enzymes needed? 8

Proteins work by molecular recognition 9

- Life is self-assembling due to molecular recognition by proteins 9
- Many proteins are molecular machines 9
- How can one type of molecule do so many tasks? 9

Evolution of proteins 9

- Development of new genes 9

DNA 10

- DNA directs its own replication 10
- Genetic code 10

Organization of the genome 12

How did life start? 12

- The RNA world 13

Proteomics and genomics 13

Summary 14

Further reading 15

Problems 15

Chapter 2 Cells and viruses 16

Cells are the units of all living systems 16

- Why are cells microscopic in size? 16

Classification of organisms 16

- Prokaryotic cells 17
- Eukaryotic cells 18
- Basic types of eukaryotic cells 21

Box 2.1 Some of the organisms used in experimental biochemical research 22

Viruses 23

Box 2.2 Structure of the drug azidothymidine 25

Summary 25

Further reading 26

Problems 26

Chapter 3 Energy considerations in biochemistry 27

- Energy considerations determine whether a chemical reaction is possible in the cell 27
- Reversible and irreversible reactions and ΔG values 28
- The importance of irreversible reactions in the strategy of metabolism 29
- Why is this metabolic strategy used in the cell? 29
- How are ΔG values obtained? 30
- Standard free energy values and equilibrium constants 30

The release and utilization of free energy from food 30

ATP is the universal energy intermediate in all life 31

- What are the structural features of high-energy phosphate compounds 31

Box 3.1 Henderson–Hasselbalch equation calculation 32

- The structure of ATP 33
- What transports the —Ⓟ around the cell? 33
- How does ATP drive chemical work? 34

Box 3.2 Calculation of ΔG value 35

- How does ATP drive other types of work? 35
- High-energy phosphoryl groups are transferred by kinase enzymes 35

Energy considerations in covalent and noncovalent bonds 36
- Noncovalent bonds are the basis of molecular recognition and self-assembly of life forms 36
- Noncovalent bonds are also important in the structures of individual protein molecules and other macromolecules 37
- Types of noncovalent bonds 37

Appendix: Buffers and pK_a values 38
- pK_a values and their relationship to buffers 39

Summary 40
Further reading 41
Problems 41

Part 2 Structure and function of proteins and membranes

Chapter 4 The structure of proteins 45

Structures of the 20 amino acids used in protein synthesis 45

The different levels of protein structure – primary, secondary, tertiary, and quaternary 47
- Primary structure of proteins 48
- Secondary structure of proteins 49
- Tertiary structure of proteins 51
- Quaternary structure of proteins 54

Protein homologies and evolution 54

Protein domains 55
- Domain shuffling 55
- Membrane proteins 56
- Conjugated proteins and post-translational modifications of proteins 56

Extracellular matrix proteins 56
- Structure of collagens 57

Box 4.1 Genetic diseases of collagen 58
- Structure of elastin 58
- Structure of proteoglycans 58

Box 4.2 Smoking, elastin, emphysema, and proteinases 59
- Adhesion proteins of the extracellular matrix 60
- Integrins are important signalling proteins 60
- Cell adhesion proteins 61

Myoglobin and haemoglobin illustrate how protein structure is related to function 62
- Myoglobin 62
- Structure of haemoglobin 63
- Binding of oxygen to haemoglobin 63
- Theoretical models to explain protein allosterism 64
- Mechanism of the allosteric change in haemoglobin 65
- The essential role of 2:3-bisphosphoglycerate (BPG) in haemoglobin function 65
- Effect of pH on oxygen binding to haemoglobin 66

Box 4.3 Sickle cell anaemia and thalassaemias 68

Summary 68
Further reading 69
Problems 70

Chapter 5 Methods in protein investigation 71

Purification of proteins 71
- Column chromatography 72
- SDS polyacrylamide gel electrophoresis 73
- Nondenaturing polyacrylamide gel electrophoresis 73

The principles of mass spectrometry 74
- Mass spectrometers consist of three principal components 75
- Ionization methods for protein and peptide mass spectrometry 75
- Types of mass analysers 76
- Types of mass spectrometers 76
- Identification of proteins using mass spectrometry without sequencing 76

Identification of proteins by limited sequencing and database searching 77

Methods of sequencing protein 77
- Classic methods 77
- Sequence analysis of proteins from gene DNA sequences 78
- Sequencing by mass spectrometry 78
- Molecular weight determination of proteins 78
- Analysis of post-translational modification of proteins 78

Determination of the three-dimensional structure of proteins 78
- X-ray diffraction 78
- Nuclear magnetic resonance spectroscopy 79
- Homology modelling 79
- An exercise in obtaining a 3-D structure from a protein database 79

Proteomics and mass spectrometry 79

Bioinformatics and databases 80

Box 5.1 Database of website addresses 80
- A bioinformatics overview 81

Appendix: Introduction to obtaining molecular structures of proteins starting with data from the Protein Data Bank 81
- Steps in displaying the human haemoglobin molecule 82

Summary 84
Further reading 85
Problems 86

Chapter 6 Enzymes 87

Enzyme catalysis 87

- The nature of enzyme catalysis 88
- The induced-fit mechanism of enzyme catalysis 89

Enzyme kinetics 90

- Hyperbolic kinetics of a 'classical' enzyme 90
- Allosteric enzymes 91

General properties of enzymes 92

- Nomenclature of enzymes 92
- Isozymes 92
- Enzyme cofactors and activators 92
- Effect of pH on enzymes 92
- Effect of temperature on enzymes 92
- Effect of inhibitors on enzymes 93
- Competitive and noncompetitive inhibitors 93

Mechanism of enzyme catalysis 94

- Mechanism of the chymotrypsin reaction 94
- The catalytic triad of the active centre 95
- The reactions at the catalytic centre of chymotrypsin 96
- What is the function of the aspartate residue of the catalytic triad? 97
- Other serine proteases 97
- A brief description of other types of protease 98

Summary 98
Further reading 99
Problems 100

Chapter 7 The cell membrane and membrane proteins 101

Basic lipid architecture of membranes 101

- The polar lipid constituents of cell membranes 101
- What are the polar groups attached to the phosphatidic acid? 103
- Membrane lipid nomenclature 105
- Why are there so many different types of membrane lipid? 105
- The fatty acid components of membrane lipids 106
- What is cholesterol doing in membranes? 106
- The self-sealing character of the lipid bilayer 106

Box 7.1 *Trans* fatty acids 107

- Permeability characteristics of the lipid bilayer 108

Membrane proteins and membrane design 108
Structures of integral membrane proteins 108

- Anchoring of peripheral membrane proteins to membranes 110
- Glycoproteins 110

Functions of membranes 110

- Membrane transport 110

Box 7.2 Calculation of energy required for transport 111
Box 7.3 Cardiac glycosides 111

- Passive transport or facilitated diffusion 113
- Gated ion channels 113
- Mechanism of the selectivity of the potassium channel 115
- Nerve-impulse transmission 116

Box 7.4 Cholinesterase inhibitors and Alzheimer's disease 117

- Myelinated neurons permit more rapid nerve-impulse transmission 120

Box 7.5 Membrane-targeted antibiotics 121

- Role of the cell membrane in maintaining the shape of the cell 121
- Cell–cell interactions – tight junctions, gap junctions, and cellular adhesive proteins 122

Summary 122
Further reading 123
Problems 124

Chapter 8 Muscle contraction, the cytoskeleton, and molecular motors 125

Muscle contraction 125

- A reminder of conformational changes in proteins 125

Types of muscle cell and their energy supply 125

- Structure of skeletal striated muscle 126
- How does the myosin head convert the energy of ATP hydrolysis into mechanical force on the actin filament? 127

Box 8.1 Muscular dystrophy 130

Control of voluntary striated muscle 131

Box 8.2 Malignant hyperthermia 131

- How does Ca^{2+} trigger contraction? 131

Smooth muscle differs in structure and control from striated muscle 132

- Control of smooth muscle contractions 132

The cytoskeleton 133

- The cytoskeleton is in a constant dynamic state 134

The role of actin and myosin in nonmuscle cells 134

- Assembly and collapse of actin filaments 134
- The role of actin and myosin in intracellular transport of vesicles 135

Microtubules, cell movement, and intracellular transport 136

Box 8.3 Effects of drugs on the cytoskeleton 138

Intermediate filaments 138

Summary 139
Further reading 139
Problems 141

Part 3 Metabolism

Chapter 9 Food digestion, absorption, distribution to the tissues, and appetite control 145

Chemistry of foodstuffs 145

Digestion and absorption 146

- Anatomy of the digestive tract 146
- What are the energy considerations in digestion and absorption? 146
- A major problem in digestion – why doesn't the body digest itself? 146

Digestion of proteins 146

- HCl production in the stomach 147
- Pepsin, the proteolytic enzyme of the stomach 147
- Completion of protein digestion in the small intestine 147
- Activation of the pancreatic proenzymes 148
- Absorption of amino acids into the bloodstream 148

Digestion of carbohydrates 148

- Structure of carbohydrates 148
- Digestion of starch 149
- Digestion of sucrose 150
- Digestion of lactose 150
- Absorption of monosaccharides 150

Digestion and absorption of fat 151

- Resynthesis of TAG in intestinal cells 152
- Chylomicrons 152

Digestion of other components of food 153

Storage of food components in the body 153

- How are the different food components stored in cells? 153
- Characteristics of different tissues in terms of energy metabolism 155
- Overall control of fuel distribution in the body by hormones 156
- Postprandial condition 156
- Fasting condition 156
- Prolonged fasting or starvation 156
- The emergency situation – fight or flight 157

Regulation of food intake: appetite control 157

- Hormones that control appetite 157
- The hypothalamus integrates appetite control hormone effects 158

Summary 159

Further reading 160

Problems 160

Chapter 10 Mechanisms of transport, storage, and mobilization of dietary components 162

Glucose traffic in the body 162

- Mechanism of glycogen synthesis 162
- Breakdown of glycogen to release glucose into the blood 165
- Key issues in the interconversion of glucose and glycogen 167
- Why does liver have glucokinase and the other tissues, hexokinase? 167
- What happens to other sugars absorbed from the intestine? 168

Box 10.1 Uridyl transferase deficiency and galactosaemia 169

Amino acid traffic in the body (in terms of fuel logistics) 169

Fat and cholesterol traffic in the body 169

- Uptake of fat from chylomicrons into cells 169

Logistics of fat and cholesterol movement in the body 170

- An overview 170
- Utilization of cholesterol in the body 171
- Lipoproteins involved in fat and cholesterol movement in the body 171
- Apolipoproteins 171
- Mechanism of TAG and cholesterol transport from the liver and the reverse cholesterol transport in the body 171

Box 10.2 Inhibitors of cholesterol synthesis 174

- Release of FFA from adipose cells 174
- How are FFA carried in the blood? 174

Summary 175

Further reading 175

Problems 176

Chapter 11 Principles of energy release from food 177

Overview of glucose metabolism 177

- Biological oxidation and hydrogen-transfer systems 177

Energy release from glucose 179

- The main stages of glucose oxidation 179
- Stage 1 in the release of energy from glucose: glycolysis 179
- Stage 2 of glucose oxidation: the citric acid cycle 180
- Stage 3 of glucose oxidation: electron transport to oxygen 182
- The electron transport chain – a hierarchy of electron carriers 182

Box 11.1 Calculation of the relationship between $\Delta G^{\circ\prime}$ value and the E_0' value 183

Energy release from oxidation of fat 185

Energy release from oxidation of amino acids 185

The interconvertibility of fuels 185

Box 11.2 A survey of vitamins 186

Summary 187
Problems 187

Chapter 12 Glycolysis, the citric acid cycle, and the electron transport system 188

Stage 1 – glycolysis 188

- Glucose or glycogen? 188
- Why use ATP here at the beginning of glycolysis? 188
- Interconversion of dihydroxyacetone phosphate and glyceraldehyde-3-phosphate 191
- Glyceraldehyde-3-phosphate dehydrogenase – an oxidation linked to ATP synthesis 191
- The final steps in glycolysis 192
- Anaerobic glycolysis 193
- The ATP balance sheet from glycolysis 193
- Transport of pyruvate into the mitochondria 193

Conversion of pyruvate to acetyl-CoA – a preliminary step before the citric acid cycle 193

- Components involved in the pyruvate dehydrogenase reaction 194

Stage 2 – the citric acid cycle 194

- A simplified version of the citric acid cycle 195
- Mechanisms of the citric acid cycle reactions 195
- What determines the direction of the citric acid cycle? 198
- Stoichiometry of the cycle 198
- Topping up the citric acid cycle 198

Stage 3 – the electron transport chain that conveys electrons from NADH and $FADH_2$ to oxygen 200

- The electron transport chain 200
- Oxidative phosphorylation – the generation of ATP coupled to electron transport 203
- How are protons ejected? 204
- ATP synthesis by ATP synthase is driven by the proton gradient 206
- Structure of ATP synthase 206
- The F_1 unit and its role in the conversion of ADP + P_i to ATP 206
- Structure of the F_0 unit and its role 208
- Mechanism by which proton flow causes rotation of F_0 209
- Transport of ADP into mitochondria and ATP out 210
- Reoxidation of cytoplasmic NADH from glycolysis by electron shuttle systems 210
- The balance sheet of ATP production by electron transport 212
- Yield of ATP from the oxidation of a molecule of glucose to CO_2 and H_2O 212
- Is ATP production the only use that is made of the potential energy in the proton-motive force? 213

Box 12.1 Inhibitors and uncouplers of oxidative phosphorylation 213

Summary 213
Further reading 214
Problems 215

Chapter 13 Energy release from fat 216

Mechanism of acetyl-CoA formation from fatty acids 216

- 'Activation' of fatty acids by formation of fatty acyl-CoA derivatives 216
- Transport of fatty acyl-CoA derivatives into mitochondria 217
- Conversion of fatty acyl-CoA to acetyl-CoA molecules inside the mitochondrion by β-oxidation 217
- Energy yield from fatty acid oxidation 218

Oxidation of unsaturated fat 218
Oxidation of odd-numbered carbon-chain fatty acids 219
Ketogenesis in starvation and type 1 diabetes mellitis 219

- How is acetoacetate made from acetyl-CoA? 219
- Peroxisomal axidation of fatty acids 220
- Where to now? 221

Summary 221
Further reading 221
Problems 221

Chapter 14 Synthesis of fat and related compounds 223

Mechanism of fat synthesis 223

- General principles of the process 223
- Synthesis of malonyl-CoA is the first step 223
- The acyl carrier protein (ACP) and the β-ketoacyl synthase 224
- Mechanism of fatty acyl-CoA synthesis 224
- Organization of the fatty acid synthesis process 224
- The reductive steps in fatty acid synthesis 224
- Fatty acid synthesis takes place in the cytoplasm 226

Synthesis of unsaturated fatty acids 227

Box 14.1 Omega fatty acids and diet 227

Synthesis of TAG and membrane lipids from fatty acids 228
Synthesis of membrane lipid bilayer 228

- Synthesis of glycerophospholipids 229
- Synthesis of new membrane lipid bilayer 230

Synthesis of prostaglandins and related compounds 231

- The prostaglandins and thromboxanes 231

Box 14.2 Nonsteroidal anti-inflammatory drugs (NSAIDs) 232

- Leukotrienes 233
- Synthesis of cholesterol 233
- Conversion of cholesterol to steroid hormones 233

Summary 234
Further reading 235
Problems 235

Chapter 15 Synthesis of glucose (gluconeogenesis) 236

- Mechanism of glucose synthesis from pyruvate 236
- What are the sources of pyruvate used by the liver for gluconeogenesis? 237
- Synthesis of glucose from glycerol 239
- Synthesis of glucose from propionate 239
- Effects of ethanol metabolism on gluconeogenesis 239
- Synthesis of glucose *via* the glyoxylate cycle in bacteria and plants 240

Summary 241
Further reading 242
Problems 242

Chapter 16 Strategies for metabolic control and their application to carbohydrate and fat metabolism 243

Why are controls necessary? 243

- The potential danger of futile cycles in metabolism 243

How are enzyme activities controlled? 244

- Metabolic control by varying the amounts of enzymes is relatively slow 244
- Metabolic control by regulation of the activities of enzymes in the cell can be effectively instantaneous 245
- Which enzymes in metabolic pathways are regulated? 245
- The nature of control enzymes 245

Allosteric control of enzymes 245

- The mechanism of allosteric control of enzymes 246
- Aspartate transcarbamylase is the classical model of an allosteric enzyme 247
- Reversibility of allosteric control 247
- Allosteric control is a tremendously powerful metabolic concept 247

Control of enzyme activity by phosphorylation 248

- Protein kinases and phosphatases are key players in control mechanisms 248
- Control by phosphorylation usually depends on chemical signals from other cells 248

General aspects of the hormonal control of metabolism 249

- How do glucagon, epinephrine, and insulin work? 249
- What is a second messenger? 249
- The second messenger for glucagon and epinephrine is cyclic AMP 249

Control of carbohydrate metabolism 250

- Control of glucose uptake into cells 250

Control of glycogen metabolism 251

- Control of glycogen breakdown in muscle 252
- Mechanism of muscle phosphorylase activation by cAMP 253
- Control of glycogen breakdown in the liver 254
- Reversal of phosphorylase activation in muscle and liver 254
- The switchover from glycogen breakdown to glycogen synthesis 254
- Mechanism of insulin activation of glycogen synthase 255
- Control of glycolysis and gluconeogenesis 255
- Muscle and liver PFK2 enzymes are different 257
- Fructose metabolism and its control differs from that of glucose 258
- Control of pyruvate dehydrogenase, the citric acid cycle, and oxidative phosphorylation 258

Controls of fatty acid oxidation and synthesis 259

- Nonhormonal controls 259
- Breakdown of acetyl-CoA carboxylase is a new type of fat metabolism control 260
- Hormonal controls on fat metabolism 260

Responses to metabolic stress 260

- Response to low ATP levels by AMP-activated protein kinase 261
- Response of cells to oxygen deprivation 261
- Mechanism of the hypoxia response 261

Integration of fat and carbohydrate metabolism controls in diabetes 262

Summary 263
Further reading 264
Problems 266

Chapter 17 Why should there be an alternative pathway of glucose oxidation? The pentose phosphate pathway 267

The pentose phosphate pathway has two main parts 267

- The oxidative section produces equal amounts of ribose-5-phosphate and NADPH 268
- Conversion of surplus ribose-5-phosphate to glucose-6-phosphate 268
- Conversion of glucose-6-phosphate to ribose-5-phosphate without NADPH generation 270
- Generation of NADPH without net production of ribose-5-phosphate 270

Box 17.1 Why do red blood cells have the pentose phosphate pathway? 270

Summary 271
Further reading 271
Problems 271

Chapter 18 Raising electrons of water back up the energy scale – photosynthesis 272

- Overview 272
- Site of photosynthesis – the chloroplast 272

The light-dependent reactions of photosynthesis 273

- The photosynthetic apparatus and its organization in the thylakoid membrane 273
- How is light energy captured? 274
- Mechanism of light-dependent reduction of $NADP^+$ 275
- Photosystem II 275
- Photosystem I 276
- How is ATP generated? 276

The 'dark reactions' of photosynthesis – the Calvin cycle 276

- How is CO_2 converted to carbohydrate? 276
- Rubisco has an apparent efficiency problem 278
- The C_4 pathway 279

Summary 280
Further reading 280
Problems 280

Chapter 19 Amino acid metabolism 282

Nitrogen balance of the body 283
General metabolism of amino acids 283

- Aspects of amino acid metabolism 283
- Glutamate dehydrogenase has a central role in the deamination of amino acids 284
- Fate of the keto acid or carbon skeletons of deaminated amino acids 285
- Genetic errors in amino acid metabolism cause diseases 286
- Methionine and transfer of methyl groups 287

Synthesis of amino acids 288

- Synthesis of glutamic acid 288
- Synthesis of aspartic acid and alanine 288
- Synthesis of serine 289
- Synthesis of glycine 289

Haem and its synthesis from glycine 289

Box 19.1 Acute intermittent porphyria 291

- Destruction of haem 291
- Synthesis of epinephrine and norepinephrine 292

The urea cycle 292

- Mechanism of arginine synthesis 293
- Conversion of citrulline to arginine 293
- Transport of the amino nitrogen from extrahepatic tissues to the liver 294
- Diseases due to urea cycle deficiencies 295
- Alternatives to urea formation exist in different animals 295

Summary 295
Further reading 296
Problems 296

Chapter 20 Nucleotide synthesis and metabolism 298

Structure and nomenclature of nucleotides 298

- The sugar component of nucleotides 298
- The base component of nucleotides 299
- Attachment of the bases in nucleotides 299

Synthesis of purine and pyrimidine nucleotides 300

- Purine nucleotides 300
- The purine salvage pathway 304
- Formation of uric acid from purines 305
- Control of purine nucleotide synthesis 305
- Synthesis of pyrimidine nucleotides 305
- How are deoxyribonucleotides formed? 306

Medical effects of folate deficiencies 307

- Thymidylate synthesis is targeted by anticancer agents such as the antifolate, methotrexate 307

Summary 308
Further reading 309
Problems 309

Part 4 Information storage and utilization

Chapter 21 The genome 313

- A brief overview 313
- The prokaryotic genome 313
- The eukaryotic genome 313

The structures of DNA and RNA 314

- DNA is chemically a very simple molecule 314
- DNA and RNA are both nucleic acids 314

The primary structure of DNA 314

- There are four different nucleotide bases in DNA 315
- Attachment of the bases to deoxyribose 315
- The physical properties of the polynucleotide components 315
- Structure of the polynucleotide of DNA 315

- Why is deoxyribose used in DNA rather than ribose? 316
- Why does RNA have uracil and DNA thymine? 317

The DNA double helix 317

- Complementary base-pairing 317
- DNA chains are antiparallel; what does this mean? 320

How is the DNA packed into a nucleus? 321

- The packing of the prokaryotic genome is different from that in eukaryotes 322

The packing of DNA in the eukaryotic nucleus changes during the cell life cycle 323

- The tightness of DNA packing is the initial control on gene activity 324
- The mitochondrial genome 325

The structure of protein-coding genes 326

- Protein-coding regions of genes in eukaryotes are split up into different sections 326

  Box 21.1 Size of genomes related to complexity of organisms 327
- Multiple gene copies facilitate evolution of new genes 327

Views on so-called junk DNA have changed dramatically 327

- The newly discovered microRNA genes of junk DNA are revolutionizing important concepts of gene control 327
- Transposons 328
- Repetitive DNA sequences 328
- Pseudogenes 328

Summary 329
Further reading 329
Problems 330

Chapter 22 DNA synthesis, repair, and recombination 332

Overall principle of DNA replication 332
Control of initiation of DNA replication in *E. coli* 333
Initiation and regulation of DNA replication in eukaryotes 333
Unwinding the DNA double helix and supercoiling 334

- How are positive supercoils removed ahead of the replicative fork? 335

The basic enzymic reaction catalysed by DNA polymerases 336
How does a new strand get started? 337
The polarity problem in DNA replication 337
Mechanism of Okazaki fragment synthesis 338

- Enzyme complex at the replicative fork in *E. coli* 338
- Processing the Okazaki fragments 340

The machinery in the eukaryotic replicative fork 341
How is fidelity achieved in DNA replication? 342

- Exonucleolytic proofreading 342
- Methyl-directed mismatch repair 343

Repair of DNA damage in *E. coli* 344
Telomeres solve the problem of replicating the ends of eukaryotic chromosomes 345

- How is telomeric DNA synthesized? 346
- Telomere shortening correlates with ageing 347
- Telomeres stabilize the ends of linear chromosomes 347

DNA damage repair in eukaryotes 347
Replication of mitochondrial DNA 347
DNA synthesis by reverse transcription in retroviruses 347
Homologous recombination 348

- Mechanism of homologous recombination in *E. coli* 348
- Recombination in eukaryotes 350

Summary 350
Further reading 351
Problems 352

Chapter 23 Gene transcription and control 353

Messenger RNA 353

- The structure of RNA 353
- How is mRNA synthesized? 353
- Some general properties of mRNA 354
- Some essential terminology 355

Gene transcription in *E. coli* 355

- What do we mean by the 5′ end of a gene? 355
- Phases of gene transcription 356
- The rate of gene transcription initiation in prokaryotes 357
- Control of transcription by different sigma factors 357
- Gene control in *E. coli*: the *lac* operon 357
- Structure of the *E. coli lac* operon 358

Gene transcription in eukaryotic cells 359

- Capping the RNA transcribed by RNA polymerase II 360
- Split genes 360

Ribozymes and self-splicing of RNA 361
Mechanism of initiation of eukaryotic gene transcription and its control 362

- Unpacking of the DNA for transcription 362
- A general overview of the differences in the initiation and control of gene transcription in prokaryotes and eukaryotes 363
- Types of eukaryotic genes and their controlling regions 364
- Most transcription factors themselves are regulated 366
- How do transcription factors promote transcriptional initiation? 367

- Vesicles involved in protein translocation from the ER and Golgi 416
- Proteins for lysosomes 416

Box 26.1 Lysosomal storage disorders 416

Proteins are sorted, packaged, and despatched from the Golgi to various destinations 416

- Clathrin-coated vesicles transport enzymes from the Golgi to lysosomes 416
- Proteins to be returned to the ER 417
- Proteins to be secreted from the cell 417

Mechanism of COP-coated vesicle formation 418

- How does a vesicle find its target membrane? 418

Synthesis of integral membrane proteins and their transport 418

Posttranslational transport of proteins into organelles 420

- Transport of proteins into mitochondria 420
- Mitochondrial matrix proteins are synthesized as preproteins 420
- Delivery of proteins to mitochondrial membranes and intermembrane space 421

Nuclear–cytoplasmic traffic 421

The nuclear pore complex 422

Nuclear localization signals 423

- Where does the energy for nuclear transport come from? 424
- Regulation of nuclear transport by cell signals and its role in gene control 425

Summary 426

Further reading 426

Problems 428

Chapter 27 Cell signalling 429

Overview 429

- Organization of this chapter 431

What are the signalling molecules? 431

- Neurotransmitters 431
- Hormones 431
- Cytokines and growth factors 432
- Vitamin D and retinoic acid 433

Responses mediated by intracellular receptors 433

Box 27.1 The glucocorticoid receptor and anti-inflammatory drugs 434

Responses mediated by receptors in the cell membrane 435

- There are two types of membrane-bound receptors 435

General concepts in cell signalling mechanisms 436

- Protein phosphorylation 436
- Binding domains of signal transduction proteins 436
- Terminating signals 437

Examples of signal transduction pathways 437

Signal transduction pathways from tyrosine kinase receptors 437

- The Ras pathway 437

Box 27.2 Some deadly toxins work by increasing or inhibiting dephosphorylation of proteins 440

- Signal sorting 441
- The phosphatidylinositide 3-kinase (PI 3-kinase) pathway and insulin signalling 441
- The JAK/STAT pathways: another type of tyrosine kinase-associated signalling system 443

G-protein-coupled receptors and associated signal transduction pathways 444

- cAMP as second messenger: epinephrine signalling – a G-protein pathway 444
- The phosphatidylinositol cascade: another example of a G-protein-coupled receptor which works *via* a different second messenger 447
- Other control roles of calcium 448
- Vision: a process dependent on a G-protein-coupled receptor 448

Signal transduction pathway using cGMP as second messenger 451

- Membrane receptor-mediated pathways 451
- Nitric oxide signalling – activation of a soluble cytoplasmic guanylate cyclase 451

Summary 453

Further reading 454

Problems 457

Chapter 28 Manipulating DNA and genes 458

Basic methodologies 458

- Some preliminary considerations 458
- Cutting DNA with restriction endonucleases 459
- Separating DNA pieces 459
- Visualizing the separated pieces 460
- Detection of specific DNA fragments by nucleic acid hybridization probes 460
- Southern blotting 460

Sequencing DNA 460

- The principle of DNA sequencing by the chain termination method 460

Amplification of DNA by the polymerase chain reaction 462

- Analysis of multiple gene expression in cells using DNA microarrays 463

Joining DNA to form recombinant molecules 464

- Vesicles involved in protein translocation from the ER and Golgi 416
- Proteins for lysosomes 416

Box 26.1 Lysosomal storage disorders 416

Proteins are sorted, packaged, and despatched from the Golgi to various destinations 416

- Clathrin-coated vesicles transport enzymes from the Golgi to lysosomes 416
- Proteins to be returned to the ER 417
- Proteins to be secreted from the cell 417

Mechanism of COP-coated vesicle formation 418

- How does a vesicle find its target membrane? 418

Synthesis of integral membrane proteins and their transport 418

Posttranslational transport of proteins into organelles 420

- Transport of proteins into mitochondria 420
- Mitochondrial matrix proteins are synthesized as preproteins 420
- Delivery of proteins to mitochondrial membranes and intermembrane space 421

Nuclear–cytoplasmic traffic 421

The nuclear pore complex 422

Nuclear localization signals 423

- Where does the energy for nuclear transport come from? 424
- Regulation of nuclear transport by cell signals and its role in gene control 425

Problems 428

Chapter 27 Cell signalling 429

Overview 429

- Organization of this chapter 431

What are the signalling molecules? 431

- Neurotransmitters 431
- Hormones 431
- Cytokines and growth factors 432
- Vitamin D and retinoic acid 433

Responses mediated by intracellular receptors 433

Box 27.1 The glucocorticoid receptor and anti-inflammatory drugs 434

Responses mediated by receptors in the cell membrane 435

- There are two types of membrane-bound receptors 435

General concepts in cell signalling mechanisms 436

- Protein phosphorylation 436
- Binding domains of signal transduction proteins 436
- Terminating signals 437

Examples of signal transduction pathways 437

Signal transduction pathways from tyrosine kinase receptors 437

- The Ras pathway 437

Box 27.2 Some deadly toxins work by increasing or inhibiting dephosphorylation of proteins 440

- Signal sorting 441
- The phosphatidylinositide 3-kinase (PI 3-kinase) pathway and insulin signalling 441
- The JAK/STAT pathways: another type of tyrosine kinase-associated signalling system 443

G-protein-coupled receptors and associated signal transduction pathways 444

- cAMP as second messenger: epinephrine signalling – a G-protein pathway 444
- The phosphatidylinositol cascade: another example of a G-protein-coupled receptor which works *via* a different second messenger 447
- Other control roles of calcium 448
- Vision: a process dependent on a G-protein-coupled receptor 448

Signal transduction pathway using cGMP as second messenger 451

- Membrane receptor-mediated pathways 451
- Nitric oxide signalling – activation of a soluble cytoplasmic guanylate cyclase 451

Problems 457

Chapter 28 Manipulating DNA and genes 458

Basic methodologies 458

- Some preliminary considerations 458
- Cutting DNA with restriction endonucleases 459
- Separating DNA pieces 459
- Visualizing the separated pieces 460
- Detection of specific DNA fragments by nucleic acid hybridization probes 460
- Southern blotting 460

Sequencing DNA 460

- The principle of DNA sequencing by the chain termination method 460

Amplification of DNA by the polymerase chain reaction 462

- Analysis of multiple gene expression in cells using DNA microarrays 463

Joining DNA to form recombinant molecules 464

Cloning DNA 465
- Cloning in plasmids 465
- Cloning using bacteriophage λ as vector 466
- Cloning very large pieces of DNA 467

Applications of recombinant DNA technology 468
- Production of human and other proteins 468
- Preparation of a cDNA library 468
- Expressing the cDNA in *E. coli* 468
- Site-directed mutagenesis 469
- PCR in forensic science 470
- Locating disease-producing genes 470

Box 28.1 Repetitive DNA sequences 471
- Knockout mice 472
- The embryonic stem (ES) cell system 473
- Gene targeting 473
- Stem cells and potential therapy for human diseases 475
- Transgenic animals and gene therapy 476

DNA databases and genomics 476

Summary 477

Problems 479

Part 5 Molecular biology in health and disease

Chapter 29 Special topics: blood clotting, xenobiotic metabolism, reactive oxygen species 483

Blood clotting 483
- What are the signals that clot formation is needed? 484
- How does thrombin cause thrombus (clot) formation? 484
- Keeping clotting in check 485
- Rat poison, blood clotting, and vitamin K 485

Protection against ingested foreign chemicals (xenobiotics) 486
- Cytochrome P450 486
- Secondary modification – addition of a polar group to products of the P450 attack 487
- Medical significance of P450s 487
- Multidrug resistance 488

Protection against reactive oxygen species 488
- Formation of the superoxide anion and other reactive oxygen species 488

Box 29.1 Red wine and cardiovascular health 489
- Mopping up oxygen free radicals with vitamins C and E 490
- Enzymic destruction of superoxide by superoxide dismutase 490

The glutathione peroxidase-glutathione reductase strategy 490

Summary 490

Further reading 491

Problems 492

Chapter 30 The immune system 493

Overview 493
- The innate immune system 493
- The adaptive immune response 493
- The problem of autoimmune reactions 494
- The cells involved in the immune system 494
- There are two arms to the adaptive immune response 494
- Where is the immune system located in the body? 494

Antibody-based or humoral immunity 495
- Structure of antibodies (immunoglobulins) 495
- What are the functions of antibodies? 495
- The different classes of antibodies 495
- Generation of antibody diversity 496

Activation of B cells to produce antibodies 497
- Deletion of potentially self-reacting B cells in the bone marrow 497
- The theory of clonal selection 497
- B cells must be activated before they can develop into antibody-secreting cells 498
- Affinity maturation of antibodies 499
- Memory cells 499

Cell-mediated immunity (killer T cells) 499
- Mechanism of action of killer T cells 501
- The role of the major histocompatibility complexes (MHCs) in the displaying of peptides on the cell surface 501
- CD proteins reinforce the selectivity of T cell receptors for the two classes of MHCs 502

Why does the human immune system reject transplanted human cells? 502

Monoclonal antibodies 502
- Humanized monoclonal antibodies 503

Summary 504

Further reading 505

Problems 506

Chapter 31 The cell cycle and its control 507

The eukaryotic cell cycle 507
- The cell cycle is divided into separate phases 507
- The cell cycle phases are tightly controlled 507

Cell cycle controls 508
- Cytokines and growth factor control in the cell cycle 508
- Cell cycle checkpoints 508
- Cell cycle controls depend on the synthesis and destruction of cyclins 508

Controls in G_1 are complex 509
- The G_1 checkpoint 509
- How is DNA damage detected? 510

Progression to S phase 510
Progression to M phase 510
Mitosis phase 510

Summary 511
Further reading 511
Problems 511

Chapter 32 Apoptosis 512

Overview 512
- What is the purpose of apoptosis? 512

There are two broad methods of initiating apoptosis 513
- Mechanism of an intrinsic pathway of apoptosis 513
- Regulation of the intrinsic pathway of apoptosis 513
- Mechanism of the extrinsic pathway of apoptosis 514

Summary 515
Further reading 515
Problems 516

Chapter 33 Cancer 517

General concepts 517
Malignant Darwinism: cancer development involves an evolutionary progression of mutations 518
- Development of colorectal cancer 519

Mutations cause cancer 519
Tumour promoters 519
The types of genetic change involved in cancer 520
Oncogenes 520
- How are oncogenes acquired? 520

Tumour-suppression genes 521
- Mechanism of protection by the p53 gene 522
- Mechanism of protection by the retinoblastoma gene 522

Molecular biology advances have potential for development of new cancer therapies 522

Summary 523
