Foreword	v
List of Contributors	xiii
Introduction	1
<i>Frédéric Thomas, Jean-François Guégan, and François Renaud</i>	
1 The evolutionary ecology of the immune response	5
<i>Gabriele Sorci, Thierry Boulinier, Michel Gauthier-Clerc, and Bruno Faivre</i>	
1.1 Introduction	5
1.2 Sources of variability	5
1.2.1 Measuring variability	6
1.2.2 Genetic variability	7
1.2.3 Environmental variability	7
1.2.4 Maternal effects	8
1.2.5 Genotype–environment interactions	9
1.3 Costs and benefits of the immune response	9
1.3.1 Energetic costs and the trade-off between immunity and life-history traits	9
1.3.2 Immunopathology	12
1.4 Sexual selection	12
1.4.1 The link between immune defences and sexual ornamentation	13
1.4.2 The immunocompetence handicap hypothesis	14
1.4.3 Honest signalling	15
1.5 The immune response and the emergence of infectious diseases	15
1.6 Conclusion	17
2. Parasitism and the evolution of life-history traits	19
<i>Yannis Michalakis</i>	
2.1 Introduction	19
2.2 Parasitism and the reactions of parasitized hosts	19
2.2.1 Defence reactions against parasitism	19
2.2.1.1 Keep the parasite out of the host	20
2.2.1.2 Impede the parasite's within host development	20
2.2.2 Reactions against the parasite's effects: modifications of life-history traits	20
2.3 Life-history traits	20
2.3.1 Some key notions	21
2.3.2 The problem of resource allocation	21
2.3.2.1 Mechanisms underlying the antagonism between functions	21
2.3.2.2 Conditions favouring antagonism between functions	22

2.3.2.3 Cases where the antagonism is not observed	22
2.4 Adjustment of allocation to reproductive effort: another way to tolerate parasitism	22
2.4.1 Mechanisms adjusting allocation of resources to reproductive effort	23
2.4.1.1 Increase in fecundity	23
2.4.1.2 Developmental acceleration	24
2.5 Limits and perspectives	25
2.5.1 Variability of life-history trait modifications	25
2.5.2 Role of the evolution of the parasite	27
2.5.3 Role of population structure	28
3 Parasites and sexual selection	31
<i>Patrice David and Philipp Heeb</i>	
3.1 Introduction	31
3.2 Sexual selection: general theoretical aspects	31
3.2.1 An issue not only for males	31
3.2.2 The theory of signal evolution	32
3.2.3 Honest signals and handicaps	33
3.2.4 Which genes should one choose to make fitter offspring?	34
3.3 Parasites and male-male competition	35
3.4 Parasites and mate choice: costs and direct benefits	36
3.5 Parasites and indirect benefits of mate choice	38
3.5.1 Choosing parasite-resistant males	38
3.5.1.1 The Hamilton-Zuk hypothesis and the lek paradox	38
3.5.1.2 Testing the Hamilton-Zuk hypothesis	39
3.5.1.3 Trade-offs	40
3.5.2 The major histocompatibility complex, parasites, and mate choice	44
3.5.3 Mate choice and resistance to parasites: a true solution to a false problem	44
4 Parasites and behaviour	49
<i>Marie-Jeanne Perrot-Minnot and Frank Cézilly</i>	
4.1 Introduction	49
4.2 Why study (and how to study) the behaviour of parasitized hosts?	49
4.2.1 Why?	49
4.2.2 How?	50
4.3 Pre-infection behaviour: parasite avoidance strategies	50
4.3.1 Avoidance through modulation of behaviour involved in parasite transmission	50
4.3.1.1 Foraging and avoidance of infection	51
4.3.1.2 Influence of parasitism on sexual behaviour	51
4.3.1.3 Group life, territoriality, and site fidelity	52
4.3.2 Prophylactic behaviour specifically related to the risk of infection	56
4.3.3 Limits to effective avoidance	59
4.4 Post-infection behaviour: eliminating or limiting pathogenic effects	59
4.4.1 Behaviours to limit or clear infection	59
4.4.2 Behaviour to kill the parasite or slow its proliferation and development	61
4.5 Manipulation by parasites	62
4.5.1 Examples of manipulation of host behaviour by parasites	62
4.5.2 Manipulation: a reaction for the host's benefit or a simple by-product of infection?	64
4.5.3 Parasite manipulation mechanisms	65

4.5.4 Unanswered questions	67
5 Parasitism and hybrid zones	69
<i>Catherine Moullia and Pierre Joly</i>	
5.1 Introduction	69
5.2 Hybridization and the fitness of hybrids	69
5.2.1 Hybridogenesis: a stable or transitory phenomenon?	70
5.2.2 The fitness of hybrids	70
5.2.2.1 The theory of ecotones	70
5.2.2.2 The theory of tension zones	70
5.3 The influence of parasitism on the future of hybridization	71
5.3.1 Parasitism in plant hybrids: hybridization favouring biodiversity	72
5.3.2 Parasitism in animal hybrids: a regulator limiting hybridization	73
5.3.2.1 An underestimated evolutionary factor	73
5.3.2.2 Studied models	73
5.4 The susceptibility of hybrid mice to helminths	74
5.4.1 The <i>musculus/domesticus</i> hybrid zone	74
5.4.1.1 Characteristics of the hybrid zone	74
5.4.1.2 The factors involved in the stability of the hybrid zone	74
5.4.2 The 'wormy' mice of the hybrid zone	75
5.4.3 The nature and origin of hybrid susceptibility	76
5.5 The resistance of water frog hybrids to helminths	78
5.5.1 The characteristics of water frog hybrids	78
5.5.2 Hybridogenesis in water frogs	79
5.5.3 Hybrid resistance to helminths	79
5.6 Conclusion and perspectives	80
6 Parasitism and regulation of the host population	83
<i>Serge Morand and Julie Deter</i>	
6.1 Introduction	83
6.2 General principles	83
6.3 Parasite diversity: consequences for regulation	85
6.4 Parasite aggregations: causes and consequences	86
6.5 Interspecific aggregation and co-existence between parasites	89
6.6 Measuring regulation using population dynamics modelling	93
6.6.1 The SIR model	93
6.6.2 The macroparasite model	94
6.6.3 Sexually transmitted pathogens: the STD model	95
6.6.4 Microparasites transmitted by a biting vector	95
6.6.5 Basic reproduction rate, R_0	95
6.6.6 Host transmission threshold	95
6.6.7 Infection peaks, age, and immunity: parasite regulation by immunity	95
6.7 Theoretical consequences for regulation of the host population	97
6.7.1 Regulation, virulence, and aggregation	97
6.7.2 Destabilization of host-parasite dynamics	98
6.8 The role of parasites in regulation of the host population: empirical evidence	98
6.9 The host community and regulation by parasites: a few examples of multi-host-parasite models	100

6.9.1	Invading a host community	100
6.9.2	Apparent competition	101
6.10	Pathology and the evolution of virulence	102
6.11	Parasitism and extinction	103
6.12	Conclusion	104
7	Parasitism and biological control	107
	<i>Éric Wajnberg and Nicolas Ris</i>	
7.1	Introduction	107
7.2	Ecological features of parasitoids	107
7.2.1	Overview	107
7.2.2	Host range	107
7.2.3	Sex determination	108
7.2.4	Other life-history traits	108
7.2.5	Co-variations among life-history traits	109
7.3	The different steps of parasitism	109
7.3.1	Pre-ovipositional steps	109
7.3.1.1	Habitat searching behaviour	109
7.3.1.2	Host searching behaviour	109
7.3.1.3	Host acceptance	110
7.3.1.4	Clutch size	111
7.3.1.5	Sex allocation	111
7.3.1.6	Patch time allocation	113
7.3.2	Post-ovipositional steps	113
7.3.2.1	Immune defences	113
7.3.2.2	Host regulation	115
7.3.2.3	Virulence and regulation factors	115
7.4	Demographic characteristics of host-parasitoid interactions	117
7.4.1	A basic demographic model	117
7.4.2	Effect of competition between hosts	118
7.4.3	Effect of the number of hosts	119
7.4.4	Effect of host distribution	120
7.4.5	Effect of the number of parasitoids	120
7.5	The use of parasitoids in plant protection	121
7.5.1	Classical biological control	121
7.5.2	Inoculation biological control	122
7.5.3	Inundation biological control	122
7.5.4	Conservation biological control	123
7.5.5	The limits of biological control	123
7.5.5.1	Economic and social costs	124
7.5.5.2	Unintended effects	124
7.5.6	Improving biological control through ecological- and population-based approaches	125
7.6	Conclusion	126
8	Health ecology: a new tool, the macroscope	129
	<i>Guillaume Constantin de Magny, François Renaud, Patrick Durand, and Jean-François Guégan</i>	

8.1	Introduction	129
8.2	Interactions between host populations and natural systems marked by exponential human growth	129
8.2.1	Complex relationships between ecosystems, hosts, and pathogens	130
8.2.2	Different explanations	131
8.2.3	Ecosystem dynamics and infectious diseases—or the snowball effect	134
8.2.4	A new school of thought: ecomedicine or health ecology	136
8.3	The ecology of infectious diseases	137
8.3.1	What happened first: biology or socio-economics?	137
8.3.2	Global climate change and the spread of infectious diseases	138
8.3.3	Ecosystem changes and health	140
8.3.4	Land use, agricultural development, intensive farming, and health	141
8.3.5	Human population growth and the evolution of infectious diseases	142
8.3.6	International travel and trade	144
8.4	Conclusion and proposals for new research perspectives	146
9	Parasitism, biodiversity, and conservation biology	149
	<i>Camille Lebarbenchon, Robert Poulin, and Frédéric Thomas</i>	
9.1	Introduction	149
9.2	Parasitism and apparent competition	149
9.2.1	Overall mechanism	149
9.2.2	Examples	150
9.3	Parasitism, ecosystem stability, and cascade effects	151
9.4	Parasites and ecosystem engineers	152
9.4.1	Ecosystem engineers	152
9.4.2	Infection of an ecosystem engineer	153
9.4.3	Parasites as engineers	154
9.5	Life-history traits and coexistence	155
9.6	Invasive species	156
9.7	Parasitism and intraspecific diversity	158
9.8	Parasitism and conservation	159
Conclusion		161
	<i>Jacques Blondel</i>	
Appendix: Methods		165
	<i>Thierry Lefèvre, Nicolas Ris, and Guillaume Mitta</i>	
A.1	Introduction	165
A.2	How to study a biological process?	165
A.2.1	Candidate approach	165
A.2.1.1	Immunological methods	165
A.2.1.2	Detection and quantification of DNA and RNA by polymerase chain reaction or reverse transcription polymerase chain reaction	166
A.2.2	Holistic approach	169
A.2.2.1	Transcriptome analysis	170
A.2.2.2	Proteome analysis	170
A.3	Studying genetic variability	173

A.3.1 Molecular markers	174
A.3.1.1 The different molecular marking techniques	175
A.3.1.2 Analytical methods	178
A.3.2 Quantitative traits	180
A.3.2.1 Genetic differentiation between populations	180
A.3.2.2 Within-population genetic variability	180
A.3.2.3 Correlations between characters	181
Glossary	183
