Preface

vii

1. Introduction

1

1.1 The start	1
1.2 Evolutionary innovations and the diversification of plant life on land	1
1.3 Plant versus animal development and evolution	2
1.4 The plant genome	3
1.5 Homology and serial homology	4
1.6 Latent homology	5
1.7 Processes of development	6
1.8 Evolution of development (evo-devo)	7
1.9 Evolutionary innovation: organs of novel form	9
1.10 Regressive evolution: the loss or reduction of organs and reversal of character states	11
1.11 Fossils and phylogeny	12
1.12 Empirical morphology versus typology	16
1.13 Plant teratology	18
1.14 Corner and Sporne: a study in opposites	19

2. The organography of stems

22

2.1 Origin and homology of stems	22
2.2 General characteristics of stems	24
2.3 The structure of the seed plant SAM	26
2.4 Variation in SAM morphology	27
2.5 Molecular signaling in the maintenance of the SAM	28
2.6 Development of stem structure	30
2.7 Organization of the stele	34
2.8 Oriented development in stems	36
2.9 Molecular control of stem orientation	37
2.10 Change of directionality with stem age	37
2.11 Chirality in stem morphology	38
2.12 Architecture of the stem	40
2.13 Molecular control of determinacy and phase change in stems	41
2.14 The thickness of stems and its consequences	42
2.15 Origin of new stems through dichotomous or lateral branching	42
2.16 Stem integration and the shoot	43

2.17	Forms adopted by the stem	44
2.18	Stem morphology associated with life form	44
2.19	Buds as specialized stems: survival and vegetative reproduction	46
2.20	Surface form	48
2.21	Stems associated with flowers	48
2.22	Special modifications of stems	50
3.	The organography of the root	54
3.1	The era of the root	54
3.2	The origin of roots	55
3.3	Homology of roots	56
3.4	Differences between root and stem	57
3.5	The radicle and its origin in the embryo	58
3.6	The root apex and root cap	60
3.7	The RAM and its control	60
3.8	Evolution of the root apex	61
3.9	Rhizodermis and root hairs	62
3.10	Primary and secondary root systems	64
3.11	Patterns of root branching	65
3.12	Secondary thickening of roots	66
3.13	Evolutionary loss of roots	67
3.14	Roots in light and air	68
3.15	Roots specialized for mechanical support	69
3.16	Root morphology and disease	71
3.17	Roots for specialized nutrition	71
4.	The organography of the leaf	79
4.1	The nature of the leaf	79
4.2	Homology of leaf-like organs	80
4.3	Molecular basis of relationship with the shoot apical meristem	82
4.4	Axes of polarity in leaf development	84
4.5	Laminal extension and the bifacial theory	85
4.6	The parts of the leaf	87
4.7	Leaf insertion	89
4.8	The shape of the simple lamina	90
4.9	Meristems, blastozones and growth of the simple leaf	92
4.10	Molecular control of simple leaf size and shape	93
4.11	Heterophylly, heteroblasty and hormones	94
4.12	Morphology of the leaf tip and base	96
4.13	Venation	97
4.14	Lobes: leaf dissection related to primary venation	98
4.15	Teeth: leaf dissection independent of the primary venation	100
4.16	Compound leaves	101
4.17	Homology of the compound leaf	103
4.18	Molecular control of compound-leaf development	104
4.19	Pseudocompound leaves	105

4.20 Stipules	106
4.21 Leaves in unusual places	108
4.22 Special forms of leaves	109
4.23 Epipeltate and ascidiolate leaves	110
4.24 Peltatocompound and diplophyllous leaves	112
4.25 Cotyledons	113
4.26 Scale leaves	114
4.27 Prophylls	115
4.28 Scale leaves underground	115
4.29 Phyllotaxy: orthostichies and parastichies	116
4.30 Helical phyllotaxy	117
4.31 Whorled and decussate phyllotaxy	118
4.32 Phyllotaxy: molecular control of divergence angle in the SAM	119
4.33 Leaf rolling and folding: ptyxis	120
5. Sporangium to seed	123
5.1 Alternation of generations	123
5.2 Evolutionary significance of the diplohaplontic life cycle	125
5.3 Gene expression and the diplohaplontic life cycle	126
5.4 Epigenetics and parental conflict	126
5.5 The evolutionary history of the life cycle	128
5.6 The sporangium	130
5.7 The sporogonium	131
5.8 The superficial sporangium	132
5.9 Megasporangia and microsporangia	133
5.10 The tetrasporangiate anther	134
5.11 The ovule as a covered megasporangium	136
5.12 The morphology of the ovule	138
5.13 The molecular control of ovule development	139
5.14 Sporogenesis and spores	142
5.15 The gametophyte and prothallus	143
5.16 The prothallus of seed plants	144
5.17 Gametogenesis and fertilization	145
5.18 The seed	148
5.19 Formation of the embryo	148
5.20 Structure of the seed-plant embryo	149
5.21 The grass embryo	150
5.22 Food reserves of the embryo	151
5.23 Molecular control of endosperm development	151
5.24 The origin of the endosperm	153
5.25 Polyembryony	153
5.26 Agamospermy	154
5.27 The biological context of agamospermy	156
5.28 The mechanism of agamospermy	157
5.29 Dormancy and growth of the new sporophyte	158

6. Sporophyll to flower	160
6.1 The origin and history of the sporophyll	160
6.2 Phyllospory and stachyospority in the euphyllophytes	161
6.3 Sporophylls of monilophytes	162
6.4 Simple strobili of gymnosperms	163
6.5 The compound strobili of conifers	164
6.6 The angiosperm flower as a simple strobilus	165
6.7 Neomorphological interpretations of the flower	166
6.8 The origin of the carpel from a gymnospermous precursor	167
6.9 Molecular theories for the origin of the flower	168
6.10 Rules of the flower: patterning of floral organs	169
6.11 Molecular control of floral organ patterning	171
6.12 The perianth	172
6.13 Merosity of the perianth	173
6.14 Modifications of the perianth members	174
6.15 A mirror up to nature: floral symmetry	178
6.16 The molecular mechanism underlying monosymmetry	180
6.17 Outside the flower: the epicalyx, calycle and petaloid bracts	182
6.18 The floral nectary	183
6.19 The androecium	184
6.20 The form of the stamen	185
6.21 The staminode	186
6.22 The carpel	186
6.23 The gynoecium	188
6.24 Placentation	189
6.25 Style and stigma	190
6.26 The sinking seed: epigyny and the receptacle	190
6.27 The fruit	192
6.28 The classification of fruits	193
6.29 Distribution of sex in flowers and inflorescences	193
6.30 Floral reduction and pseudanthy	196
6.31 The inflorescence: phase change in the SAM	198
6.32 Inflorescences	199
6.33 Molecular basis of determinacy in the inflorescence	199
6.34 Terminal and lateral inflorescences	201
6.35 Types of racemose inflorescence	202
6.36 Types of cymes	204
6.37 The leaves of inflorescences	205
6.38 Leaves of grass partial inflorescences	206
References	208
Index	243
