

Contents

1 What models can do for the life sciences	1
1.1 Donkey and <i>Diplodocus</i>	1
1.2 What is a mathematical model?	3
1.3 Why use differential equations?	4
1.4 A modelling recipe	6
1.5 Defining biological systems	8
Further reading	9
Exercises	10
2 Basic modelling concepts and techniques	11
2.1 Alcohol metabolism	11
2.2 The food intake rate of a predator	14
2.3 An enzyme with a modulating ligand	15
2.4 Mineral dynamics of a mussel in a tidal zone	17
2.5 The salt balance in a pond snail	18
2.6 Fluxes and flows between compartments	20
2.6.1 Blood volumes in a pond snail	21
2.6.2 Circulation of lymphocytes	23
2.6.3 Closed, connected compartmental systems	25
2.7 Subcellular dynamics	27
2.7.1 Dynamics of a metabolite and an enzyme	27
2.7.2 A genetic switch	29
2.7.3 A genetic clock	31
Further reading	32
Exercises	33
3 Working with ordinary differential equations	41
3.1 Solutions and how to avoid calculating them	41
3.2 Elementary techniques for solving scalar first-order ODEs	42
3.2.1 Separation of variables	43
3.2.2 Variations on the theme of $y_0 \exp\{\lambda t\}$	43
3.3 Linear systems	45
3.3.1 The basic idea: $\mathbf{y}(t) = \mathbf{e} \cdot \mathbf{z}(t)$	45
3.3.2 Other building blocks; complex eigenvalues	47
3.3.3 When there are fewer than n distinct eigenvalues	48
3.3.4 Stability of a linear system with $n = 2$; Routh-Hurwitz criteria	49
3.3.5 Carving up phase space	50
3.4 Non-linear systems	52

3.4.1	Equilibrium points in non-linear systems	52
3.4.2	Phase plane analysis	53
3.5	Model simulations	56
	Further reading	57
	Exercises	57
4	Models and data analysis	63
4.1	Measurement	63
4.1.1	Empirical dimension	64
4.1.2	Measurement units	64
4.1.3	Dimensional analysis	65
4.1.4	Units and scales of measurement	67
4.2	Parameter estimation and statistics	69
4.2.1	Least sum-of-squares fitting	69
4.2.2	Simultaneous fitting	70
4.2.3	Step-wise parameter fitting: the peeling method	71
4.2.4	Support from parameter estimates: numerical versus structural confidence	72
4.2.5	Testing whether the model fits the data	73
4.2.6	Confidence regions	75
4.3	Parameter values for extensive models	76
	Further reading	78
	Exercises	79
5	Modelling principles	81
5.1	Model structure	81
5.2	Model assumptions	82
5.2.1	Counting assumptions	82
5.2.2	Implicit and explicit assumptions	83
5.2.3	Strong and weak assumptions	83
5.2.4	Stringent and relaxed assumptions	83
5.3	Applications of models	84
5.4	Good modelling practice	85
5.4.1	Simplifying a model	85
5.4.2	Consistency and coherency	86
5.4.3	<i>Petito principii</i> or begging the question	86
5.4.4	Saliency and relevance	87
5.4.5	Tailoring assumptions to attractive equations	87
5.4.6	Naming the quantities in the model	87
5.4.7	Adopting an engineer's point of view	88
5.5	From models to theories	88
5.5.1	Neutral analogies make models useful	89
5.5.2	How to judge successful predictions, or failed ones	90
	Exercises	92
6	Growth of populations and of individuals	93
6.1	Basic models of population growth	93
6.1.1	Limits on growth	94

6.1.2	Interference: logistic growth and variations	95
6.1.3	Positive interference	96
6.1.4	Harvesting	96
6.2	Trophic cascades and food webs	98
6.3	Microbial growth in a chemostat	101
6.3.1	Basic chemostat equations	102
6.3.2	Logistic growth in the chemostat	103
6.3.3	Towards a model for the relative growth rate	104
6.4	Growth of individuals	107
6.4.1	The Bertalanffy–Liebig model	108
6.4.2	Beyond Bertalanffy–Liebig	110
6.4.3	The stoichiometric perspective	111
	Further reading	113
	Exercises	113
7	Infection and immunity	119
7.1	Infection dynamics in a population	119
7.1.1	Epidemics	120
7.1.2	Imperfect immunity	121
7.1.3	Latency	122
7.2	Infection and immunity within the host organism	123
7.2.1	Immune control and viral runaway	123
7.2.2	The viral quasi-species	124
7.2.3	The T cell response	125
7.2.4	The T cell repertoire	129
	Further reading	131
	Exercises	132
8	Physiology	137
8.1	The cardiovascular system	137
8.1.1	Control of blood pressure and blood volume	138
8.1.2	Beat-to-beat variations in the heart	139
8.1.3	Arterial pulse waves	142
8.2	Renal physiology	144
8.3	Hydromineral physiology	147
8.3.1	Cellular homeostasis	147
8.3.2	Excitability	150
8.4	Glucose homeostasis	153
8.4.1	Towards the simplest possible model	154
8.4.2	Control of insulin secretion	155
	Further reading	158
	Exercises	158
9	Stochastic models	167
9.1	Butterflies, again	167
9.1.1	Time of death and time of extinction	168
9.1.2	The hazard rate	169
9.1.3	Probability dynamics	171

9.2	Eradication of cancer	172
9.3	The reproductive number	176
9.4	Signalling fidelity	177
9.4.1	Intrinsic stochastic noise	178
9.4.2	Adding extrinsic noise	179
9.5	Spatial fluctuations	180
9.5.1	Adaptor-mediated receptor signalling	181
9.5.2	Pair dynamics	182
	Further reading	185
	Exercises	185
A	Maths miscellany	191
A.1	Sets	191
A.2	Relations and functions	191
A.3	Derivatives and integrals	193
A.4	Taylor series	196
A.5	Useful techniques	197
A.5.1	Some standard solutions	197
A.5.2	Commonly used Taylor series	197
A.5.3	Stirling's formula	198
A.5.4	L'Hôpital's rule	198
A.5.5	Partial fraction decomposition	198
A.5.6	Lagrange multipliers	199
A.5.7	Some sums	199
A.6	Complex numbers	200
A.7	Vectors and matrices	201
A.8	Probability	205
A.8.1	Fundamental laws of probability	205
A.8.2	Random variables and their distributions	205
A.8.3	Expectation and variance	207
A.8.4	Some distributions often encountered in practice	210
A.9	Problem solving	211
	Further reading	212
B	From Boltzmann to Nernst	213
B.1	Boltzmann	213
B.2	Work, heat, temperature, and entropy	214
B.3	Nernst	215
	Further reading	216
C	Ultimate behaviour of a closed, connected, compartmental system	217
	Further reading	218
D	Buckingham's theorem	219
	Further reading	219
E	Minimizing the sum of squares with respect to the parameters	220
	Further reading	221

F Global sensitivity analysis: parameter transformations for 'large' systems	222
F.1 The scalar case	222
F.2 Multidimensional dynamics	225
F.3 Non-autonomous dynamics and periodic forcing	225
Further reading	227
Index	228
