Chemical ecology in aquatic systems—an introduction	xiv
<i>Christer Brönmark and Lars-Anders Hansson</i>	
1 Aquatic odour dispersal fields: opportunities and limits of detection, communication, and navigation	1
<i>Jelle Atema</i>	
1.1 Odour dispersal: where are the molecules?	3
1.1.1 A question of scale	3
1.1.2 Odour plumes	4
1.1.3 Near-source coincidence	7
1.1.4 Boundary layers	7
1.2 Signal detection: accessing odour	8
1.2.1 Detection threshold	8
1.2.2 Signal-to-noise ratios	8
1.2.3 Intermittency: a patch in space is a pulse in time	8
1.2.4 Aquatic noses	11
1.3 Odour information currents	12
1.4 Navigation in odour fields	13
1.4.1 Odour-flow coincidence would signal the close proximity of the source	14
1.5 Conclusion	15
References	16
2 Information conveyed by chemical cues	19
<i>Eric von Elert</i>	
2.1 Habitat and food finding	19
2.2 Induced defences in primary producers and bacteria	23
2.3 Induced defences in animal prey	25
2.3.1 Morphological changes	25
2.3.2 Life history and behavioural changes	26
2.4 Alarm cues in invertebrates	27
2.5 Alarm cues in vertebrates	28
2.6 Pheromones and quorum sensing	29
2.7 Dispersal and settlement cues	32

2.8 Pheromones	32
2.9 Conclusions	33
References	34
3 Pheromones mediating sex and dominance in aquatic animals	39
<i>Thomas Breithaupt and Jörg D. Hardege</i>	
3.1 What is a pheromone?	39
3.2 Production, transmission, and reception	40
3.3 Sex pheromones in fish—spying males and the evolution of chemical communication	41
3.3.1 The time course of reproductive behaviour in cyprinid fish	42
3.3.2 Exceptions from hormonal pheromone communication systems	44
3.4 Sex pheromones in crustaceans—indicators of female receptivity and triggers of mate guarding	45
3.5 Pheromones mediating dominance interactions	47
3.6 Pheromones mediating spawning without courtship— <i>Arenicola marina</i>	48
3.7 Pheromones mediating broadcast spawning	49
3.8 Future perspectives and applications of pheromone research	51
References	53
4 Chemical signals and kin biased behaviour	57
<i>Gabriele Gerlach and Cornelia Hinz</i>	
4.1 Living with relatives	57
4.1.1 Kin selection	57
4.1.2 Kin recognition	58
4.1.3 Evidence for kin recognition and kin associations in the aquatic environment	58
4.2 Chemical components involved in kin recognition	64
4.2.1 The role of MHC-molecules in the immune system	64
4.2.2 Influence of MHC-genotype on social interactions	64
4.2.3 MHC and social interactions in amphibians and fish	65
4.3 Concluding remarks	66
References	66
5 The use of chemical cues in habitat recognition and settlement	72
<i>Gabriele Gerlach and Jelle Atema</i>	
5.1 Olfactory driven choice of settlement habitat in invertebrates	73
5.2 Habitat recognition in coral reef fish	75
5.2.1 Imprinting	78
5.2.2 Climate change and pollution impair habitat recognition	78
5.3 Concluding remarks	79
References	79
6 Migration and navigation	82
<i>Ole B. Stabell</i>	
6.1 Introduction	82
6.2 Bottom-dwelling animals	82
6.2.1 Invertebrate homing to specific sites after foraging	82
6.2.2 Trail making and trail detection in benthic invertebrates	84
6.2.3 Mechanisms of chemosensory trail detection in molluscs	85

6.3 Free-swimming animals	85
6.3.1 Stationary behaviour and site fidelity	86
6.3.2 Substrate marking by fish	86
6.3.3 Feeding migration and homing for reproduction	88
6.3.4 Homing theories	89
6.3.5 Chemical cues involved in site marking and site detection	90
6.3.6 Long distance homing and navigation	91
6.4 Concluding remarks	92
References	93
7 Death from downstream: chemosensory navigation and predator-prey processes	96
<i>Marc Weissburg</i>	
7.1 Plumes—a very brief review	96
7.2 Navigational strategies	99
7.3 Ecological consequences	103
7.4 Chemosensory guidance at different scales	106
7.5 Concluding remarks	107
References	108
8 The taste of predation and the defences of prey	111
<i>Linda Weiss, Christian Laforsch, and Ralph Tollrian</i>	
8.1 Predation drives evolution of prey	111
8.1.1 Modes of predator detection	111
8.1.2 Chemical cues as indicators of <i>general</i> and <i>acute</i> predation threat	113
8.1.3 Predator-induced defences	114
8.1.4 Multi-predator environments	115
8.2 <i>Daphnia</i> as a model organism for studies of the ecology and evolution of phenotypic plasticity	116
8.2.1 Inducible defences in <i>Daphnia</i>	116
8.2.2 Mechanisms of kairomone perception and information processing in <i>Daphnia</i>	118
8.2.3 Receptors and integration of chemical cues	119
8.2.4 Neuronal signalling	120
8.2.5 Cellular components	121
8.2.6 Developmental time frames	122
8.3 Synopsis and future directions	123
References	123
9 The evolution of alarm substances and disturbance cues in aquatic animals	127
<i>Douglas P. Chivers, Grant E. Brown, and Maud C.O. Ferrari</i>	
9.1 Alarm substances	127
9.1.1 The taxonomic distribution of alarm substances	127
9.1.2 The conservation of alarm substances	128
9.2 The chemistry of alarm substances	129
9.3 The ecology of alarm substances	130
9.4 The evolution of alarm substances	132
9.4.1 Predation-centred hypotheses	133
9.4.2 Immune system-centred hypotheses for the evolution of alarm substances	134
9.4.3 Multiple selection pressures?	135

9.5 Disturbance cues	135
9.5.1 The taxonomic distribution of disturbance cues	135
9.5.2 The chemistry of disturbance cues	136
9.5.3 Evolution of disturbance signals	136
9.6 Next steps	136
