
Table of Contents

Chapter 1	Introduction	1
What is a microbe?		1
Why study microbial ecology?		1
Microbes cause diseases of macroscopic organisms, including humans		2
Much of our food depends on microbes		3
Microbes degrade and detoxify pollutants		4
Microbes can be useful model systems for exploring general principles in ecology and evolution		5
Some microbes are examples of early life on earth and perhaps of life on other planets		6
Microbes mediate many biogeochemical processes that affect global climate		6
Microbes are everywhere, doing nearly everything		8
How do we study microbes in nature?		10
The three kingdoms of life: Bacteria, Archaea, and Eukarya		12
Functional groups of microbes		15
Autotroph versus heterotroph		16
Phototroph versus chemotroph		16
Sources of background information		16
Chapter 2	Elements, biochemicals, and structures of microbes	19
Elemental composition of microbes		19
Elemental ratios in biogeochemical studies		21
C:N and C:P ratios for various microbes		22
Biochemical composition of bacteria		23
Biochemical composition of eukaryotic microbes		24
Explaining elemental ratios		25
Architecture of a microbial cell		26
Membranes of microbes and active transport		26
Cell walls in prokaryotes and eukaryotes		27
Components of microbial cells as biomarkers		29

Extracellular structures	31
Extracellular polymers of microbes	31
Flagella, cilia, fimbriae, and pili	32
Chapter 3 Physical-chemical environment of microbes	35
Water	35
Temperature	36
The effect of temperature on reaction rates	37
pH	39
Salt and osmotic balance	40
Oxygen and redox potential	41
Light	42
Pressure	43
The consequences of being small	44
Microbial life in natural aquatic habitats	46
Motility and taxis	47
Submicron- and micron-scale patchiness in aqueous environments	48
Microbial life in soils	49
Water content of soils	49
Interactions between temperature and water content in soils	50
The biofilm environment	51
Chapter 4 Microbial primary production and phototrophy	55
Basics of primary production and photosynthesis	55
Light and algal pigments	56
Transport of inorganic carbon	57
The carbon dioxide-fixing enzyme	59
Primary production, gross production, and net production	61
Primary production by terrestrial higher plants and aquatic microbes	63
The spring bloom and controls of phytoplankton growth	64
Major groups of bloom-forming phytoplankton	66
Diatoms	67
Coccolithophorids and the biological pump	67
<i>Phaeocystis</i> and dimethylsulfide	68
Diazotrophic filamentous cyanobacteria	69
After the bloom: picoplankton and nanoplankton	71
Competition for limiting nutrients	71
Primary production by coccoid cyanobacteria	73
Photoheterotrophy in the oceans	74
Uptake of organic material by algae	75
Aerobic anoxygenic phototrophic bacteria	75
Rhodopsin in photoheterotrophic bacteria	76
Ecological and biogeochemical impacts of photoheterotrophy	77

Chapter 5	Degradation of organic material	79
Mineralization of organic material in various ecosystems		80
Who does most of the respiration on the planet?		81
Slow and fast carbon cycling pathways		83
Chemical characterization of detrital organic material		84
Dissolved organic material		85
Detrital food webs		86
DOM and the microbial loop		88
Hydrolysis of high molecular weight organic compounds		91
Lignin degradation		93
Uptake of low molecular weight organic compounds: turnover versus reservoir size		93
Chemical composition and organic material degradation		94
Release of inorganic nutrients and its control		96
Photo-oxidation of organic material		96
Refractory organic matter		97
Chapter 6	Microbial growth, biomass production, and controls	99
Are bacteria alive or dead?		99
Activity state of bacteria in soils and sediments		101
Activity state of soil fungi		101
Microbial growth and biomass production		102
Growth of pure cultures in the lab: batch cultures		102
Growth of pure cultures in the lab: continuous cultures		103
Measuring growth and biomass production in nature		104
Bacterial biomass production in aquatic environments		105
Bacterial growth rates in aquatic environments		107
Growth rates of bacteria and fungi in soils		108
What sets biomass production and growth by microbes in nature?		109
Temperature effects on growth and carbon cycling		109
Temperature effects on fungi versus bacteria in soils		111
Limitation by organic carbon		111
Limitation by inorganic nutrients		113
Co-limitation and interactions between controlling factors		114
Competition and chemical communication between organisms		115
Chapter 7	Predation and protists	117
Bacterivory and herbivory in aquatic habitats		118
Grazers of bacteria and fungi in soils and sediments		120
Grazing mechanism for protists		121
Factors affecting grazing		122
Prey number and predator-prey cycles		123
Size relationships of predator and prey		125
Chemical recognition and composition		126

Defenses against grazing	128
Effect of grazing on prey growth	129
Grazing by ciliates and dinoflagellates	129
Ciliates as herbivores in aquatic ecosystems	129
Ciliates in soils and sediments	130
Heterotrophic dinoflagellates	131
Fluxes from microbial food webs to higher trophic levels	132
Mixotrophic protists and endosymbiosis	133
Phagotrophy, endosymbiosis, and algal evolution	135
Chapter 8 Ecology of viruses	137
What are viruses?	137
Viral replication	138
Temperate viruses in nature	139
Contact between host and virus at the molecular scale	140
The number of viruses in natural environments	141
Counting viruses by the plaque assay	142
Counting viruses by microscopy	142
Variation in viral abundance in nature	144
Mortality of bacteria due to viruses	146
Percentage of infected cells	146
The viral reduction method	146
Contribution of viruses versus grazers to bacterial mortality	147
Viral production and turnover	148
Viral decay and loss	148
Viruses of phytoplankton	149
Viruses are not grazers	150
Viral shunt and DOM production	151
Population dynamics of a virus and its host	151
Genetic exchange mediated by viruses	152
Chapter 9 Community structure of microbes in natural environments	157
Taxonomy and phylogeny via genes	157
Introduction to 16S rRNA-based methods	158
The species problem	159
Diversity of bacterial communities	160
The paradox of the plankton	162
Differences between cultivated and uncultivated microbes	163
Types of bacteria in soils, freshwaters, and the oceans	164
Archaea in non-extreme environments	166
Everything, everywhere?	167
What controls diversity levels and bacterial community structure?	168
Temperature, salinity, and pH	168
Moisture and soil microbial communities	169

Organic material and primary production	170
Predation and viral lysis	171
Problems with 16S rRNA as a taxonomic and phylogenetic tool	171
Community structure of protists and other eukaryotic microbes	173
Types of protists and other eukaryotic microbes in nature	173
Relevance of community structure to understanding processes	175
 Chapter 10 Genomes and metagenomes of microbes and viruses	 177
What are genomics and environmental genomics?	177
Turning genomic sequences into genomic information	178
Lessons from cultivated microbes	179
Similar rRNA genes, dissimilar genomes	179
Genome size	180
Organization of eukaryotic versus prokaryotic genomes	181
Growth rates and genomics	182
Chromosomes, plasmids, and replicons	183
Lateral gene transfer	184
Genomes from uncultivated microbes: metagenomics	185
Metagenomic approaches	186
The proteorhodopsin story and others	187
Metagenomics of a simple community in acid mine drainage	188
Useful compounds from metagenomics and activity screening	188
Metatranscriptomics and metaproteomics	189
Proteomics and metaproteomics	191
Metagenomics of viruses	191
RNA viruses	193
 Chapter 11 Processes in anoxic environments	 195
Introduction to anaerobic respiration	195
The order of electron acceptors	197
Oxidation of organic carbon by various electron acceptors	199
Limited by concentrations and supply	199
Effect of chemical form	200
The anaerobic food chain	201
Fermentation	202
Interspecies hydrogen transfer and syntrophy	203
Sulfate reduction	204
Electron donors for sulfate reduction	205
Sulfur oxidation and the rest of the sulfur cycle	207
Non-phototrophic sulfur oxidation	208
Sulfide oxidation by anoxygenic photosynthesis	209
The carbon source for sulfur oxidizers	210
Methane and methanogenesis	210
Methanotrophy	212

Aerobic methane degradation	212
Anaerobic methane oxidation	213
Anaerobic eukaryotes	214
Chapter 12 The nitrogen cycle	217
Nitrogen fixation	218
Nitrogenase, the nitrogen-fixing enzyme	218
Solving the oxygen problem	219
N ₂ fixation in nature	220
Limitation of N ₂ fixation	221
Ammonium assimilation, regeneration, and fluxes	221
Ammonium release in anoxic systems	223
Ammonium uptake versus excretion, immobilization versus mobilization	223
Ammonia oxidation, nitrate production, and nitrification	224
Aerobic ammonia oxidation by bacteria	225
Archaeal ammonia oxidation	226
Controls of aerobic ammonia oxidation	228
Nitrite oxidation and the second step in nitrification	229
Anaerobic ammonia oxidation	229
Dissimilatory nitrate reduction and denitrification	230
Dissimilatory nitrate reduction to ammonium	231
Denitrification versus anaerobic ammonium oxidation	232
Sources and sinks of nitrous oxide	233
Balancing N loss and N₂ fixation	234
Chapter 13 Introduction to geomicrobiology	237
Cell surface charge, metal sorption, and microbial attachment	237
Metal sorption	238
Iron uptake mediated by siderophores and other metal ligands	239
Attachment of microbes to surfaces	241
Biomining by microbes	241
Carbonate minerals	242
Phosphorus minerals	244
Iron mineral formation by non-enzymatic processes	245
Magnetite and magnetotactic bacteria	246
Manganese and iron-oxidizing bacteria	248
Iron oxidation	248
Manganese-oxidizing bacteria	250
Weathering and mineral dissolution by microbes	251
Dissolution by acid and base production	251
Dissolution by low and high molecular weight chelators	252
Geomicrobiology of fossil fuels	253

Chapter 14	Symbiosis and microbes	257
Microbial residents of vertebrates		259
Microbial symbioses with insects		261
Microbial symbionts in termites		261
Aphids- <i>Buchnera</i> symbiosis		262
Symbiotic relationship between ants and fungi		263
Symbiotic microbes in marine invertebrates		265
Endosymbionts in <i>Riftia</i> and other sulfide-oxidizing symbionts		266
Bioluminescent symbionts in the oceans		269
Microbe-plant symbioses		271
Diazotrophic bacteria and plant symbioses		271
Fungi-plant symbioses		273
Concluding remarks		275
References		277
