1. Identifying proteins for proteome studies: a two-dimensional gel electrophoresis approach 1

*Jean-Charles Sanchez, Marc R. Wilkins, Ron D. Appel,
Keith L. Williams, and Denis F. Hochstrasser*

1. Introduction	1
2. Preparative protein separation (2D PAGE) and detection	3
Sample preparation	3
Immobilized pH gradient as first-dimensional separation	5
SDS-PAGE as second-dimensional separation	8
Electroblotting	9
Protein detection	11
3. Protein identification	12
Immunodetection	12
Amino acid composition analysis	14
Edman degradation 'sequence tag' identification	18
Peptide mass fingerprinting and amino acid composition identification	19
4. Computer gel analysis and protein identification software	21
SWISS-2DPAGE and ExPASy	22
AAComIdent	22
Other tools	25
5. Conclusion	25
Acknowledgements	25
References	26

2. Expressing cloned genes in *Escherichia coli* 29

Steve Bass and Maria Yang

1. Introduction	29
2. Vector design	30
3. Protein production in the cytoplasm	32
Intracellular production of rat growth hormone	32
Optimizing translation initiation	46

Contents

4. Protein production in the periplasm	47
Periplasmic production of the NT-3-binding domain of the human	
TrkC receptor	49
Optimizing protein translocation	51
5. Optimizing strains and production conditions	51
Protease-deficient strains	52
6. Conclusion	54
Acknowledgements	54
References	54

3. Folding proteins 57

Rainer Rudolph, Gerald Böhm, Hauke Lilie, and Rainer Jaenicke

1. Introduction	57
2. Monitoring protein folding	58
Catalytic function	59
Ligand binding	60
ELISA techniques	60
Spectroscopic techniques	60
Limited proteolysis	61
Chromatographic techniques	62
Gel electrophoresis	62
Cell culture	63
Solubility	63
3. Protein unfolding	64
Choice of unfolding conditions	65
Isolation and solubilization of inclusion body protein	65
4. Protein folding	67
Minimizing aggregation	68
Temperature, pH, and time	69
Low molecular weight additives	69
Other parameters	72
5. Equilibrium transitions of folding and association	73
6. Kinetics of folding and association	74
7. Folding proteins with concomitant disulfide bond formation	75
Denaturation/reduction	76
Renaturation/reoxidation	77
8. Association of oligomeric proteins	82
Dissociation/association	82
Refolding and reactivation	83
Reassociation	85

Contents

9. Effects of ligands and other proteins	88
Cofactors	88
Coenzymes and substrates	91
10. Effect of auxiliary proteins assisting protein folding	91
Folding catalysts	92
Chaperones	96
References	96
 4. Ligand binding	 101
<i>Alexander Levitzki</i>	
1. Introduction	101
2. The study of receptors	103
3. Techniques of ligand binding to receptors	103
Measurement of ligand binding	103
Assay of membrane receptors	104
Assay of solubilized receptors	112
Titration microcalorimetry	113
Surface plasmon resonance	114
'Non-specific' binding	116
4. Analysis of equilibrium binding data	118
Analysis and plotting of binding data	118
Displacement experiments	120
5. Non-Michaelian ligand binding	122
Distinguishing negative co-operativity from a heterogeneous population of sites	123
Receptor-to-effector coupling and negative co-operativity	126
6. The accurate determination of dissociation constants	127
References	128
 5. Ligand blotting	 131
<i>Anne K. Soutar and David P. Wade</i>	
1. Introduction	131
2. Solubilization of cells and tissues	132
3. Fractionation by polyacrylamide gel electrophoresis	134
Choice of method	134
4. Transfer of proteins from gel to membrane	141
5. Binding and detection of the ligand	144
Blocking the membrane	144
Choice of ligand and detection system	145

Contents

Labelling of ligands and antibodies	147
Detection of bound ligands	149
6. Quantification by ligand blotting	151
7. Applications	152
Acknowledgements	152
References	153
6. Affinity labelling	155
<i>Roberta F. Colman</i>	
1. Introduction	155
2. Design of affinity label	156
3. Synthesis of affinity label	160
5'- <i>p</i> -Fluorosulfonylbenzoyl-8-azidoadenosine (5'-FSBAzA)	160
Adenosine 5'- <i>O</i> -[S-(4-bromo-2,3-dioxobutyl)]thiophosphate (AMPS-BDB)	162
S-(4-Bromo-2,3-dioxobutyl)glutathione (S-BDB-G)	164
4. Conditions for reaction of enzyme and affinity label	165
5. Selection of functional property to monitor affinity labelling reaction	166
6. Dependence of rate constant on reagent concentration	170
7. Effect of ligands on rate of modification by affinity label	173
8. Measurement of reagent incorporated	175
9. Characterization of kinetic and binding properties of affinity-labelled enzyme	178
10. Isolation of specifically-labelled peptides	178
11. Conclusions	182
References	182
7. Chemical cross-linking and protein function	185
<i>Ronald Kluger</i>	
1. Introduction	185
Background: chemical modification of proteins	185
Cross-linking in general	186
Cross-linking proteins	186
2. Tactics	188
Controls	188
Experimental design	188

Contents

Multiple reaction sites	189
Selectivity in cross-linking by design	189
3. Types of reagents for cross-link formation	190
Reagent cataloguing: Uy-Wold classifications	190
Addition and Baldwin's rules	190
The possibility of selective photochemically-activated cross linkers	191
Improving on selectivity by using multifunctionality	191
Sequential introduction of additional cross-links	193
Reactivity and selectivity	193
Linker structure	194
Hydrophilicity	197
4. Functional effects of cross-linking	197
5. Reagents: selection, design, and synthesis	198
Select or design reagents?	198
6. Specialized commercial reagents and protocols	199
Bis-imidates	199
The Pierce reagent catalogue	200
7. Non-specific stabilization: glutaraldehyde	202
8. Affinity cross-linking	203
9. Other designed reagents: electrostatic selectivity	205
10. Analysis	207
Considerations for analysis	207
Estimating heterogeneity: ion exchange HPLC analysis	207
Purification of components	208
Subunit analysis and separation	208
Logical analysis of component structures	208
Peptide analysis	208
11. Addition of ligands via cross-linkers: bioconjugation	209
Ligands attached to cross-linker	209
Cross-linkers with reactive sites	210
12. Concluding remarks	211
Reagent developments	211
Enhanced physical methodology	211
Acknowledgements	211
References	212
 8. Analysis of sequence-specific DNA-binding proteins	 215
<i>Daniela Rhodes and Louise Fairall</i>	
1. Introduction	215

2. Some general considerations	216
3. Formation of sequence-specific protein-DNA complexes	217
Preparation of DNA fragments containing the binding site for a protein	217
Competitor DNA	219
Carrier protein	219
Purification of DNA-binding proteins	219
Formation of the HSF-DNA complex	220
Formation of the TTK-DNA complex	220
4. Bandshift assay	221
Technical aspects of non-denaturing gels	222
Non-denaturing agarose gels	222
Non-denaturing polyacrylamide gels	223
Visualization of gels	223
Electrophoretic fractionation of the HSF-DNA complex	224
Fractionation of protein-DNA complexes prior to footprinting analysis	224
Estimation of dissociation constants	224
5. Footprinting assay	227
Factors that affect the clarity of a footprint	229
How to choose a footprinting reagent	229
DNase I as a probe	231
Hydroxyl radical as a probe	233
Dimethylsulfate as a probe (methylation protection)	234
Visualization of the footprint on denaturing polyacrylamide gels	236
Assignment of bands in the autoradiograph to DNA sequence	237
Results: different reagents reveal different details of the footprint	238
6. Quantitative analysis of footprinting results	238
Densitometry	238
Calculation of difference probability plots	239
Plotting of the footprinting data onto an opened-out helix	240
A method for defining DNA binding sites using the structure of DNase I	241
7. Some other applications for bandshift and footprinting gels	242
Acknowledgements	243
References	243
9. Purification of sequence-specific DNA-binding proteins by affinity chromatography	245
<i>Ken B. Kaplan and Peter K. Sorger</i>	
1. Introduction	245

Contents

2. Preparation of extracts from <i>Saccharomyces cerevisiae</i>	246
Strains and growth conditions	246
Whole-cell and nuclear extracts compared	247
3. Protein-DNA binding conditions	254
Carrier DNA	255
Binding buffers and conditions	255
4. Identification of sequence-specific DNA-binding proteins	257
Cross-competition analysis	257
Estimating association and dissociation rates	258
Photo-activated cross-linking	259
5. DNA affinity chromatography	264
Buffers	264
Precipitation with ammonium sulfate	264
Fractionation of DNA-binding proteins by ion exchange chromatography	265
Removing non-specific DNA-binding proteins	266
Purification by DNA affinity chromatography	268
6. Conclusion	277
Acknowledgements	277
References	277
 10. Chemical modification	 279
<i>Taiji Imoto and Hidenori Yamada</i>	
1. Introduction	279
2. General approach to chemical modification	280
Modification of activity	280
Modification of stability	280
Purification of the modified protein	280
Identification of the modified residue	282
3. Consequences of modification	283
Binding groups	283
Catalytic groups	283
Stability	284
4. Carboxyl groups	285
Amidation	285
Esterification	289
5. Amino groups	292
Acetylation	293
Attachment of polyethylene glycol	294
6. Thiol groups	296
Reduction and S-carboxymethylation of disulfide-containing proteins	296

Contents

Introduction of thiol groups (thiolation)	298
Disulfide bond formation between proteins	301
7. Tyrosine residues (nitration)	302
8. Tryptophan residues (oxidation)	303
<i>N</i> -Bromosuccinimide (NBS)	305
Ozone	306
Iodine	306
9. Intramolecular cross-linking	307
Cross-linking of lysozyme between Lys13 (ϵ -amino) and Leu129 (α -carboxyl) by imidazole catalysed carbodiimide reaction	308
Cross-linking of lysozyme between Lys1 (ϵ -amino) and His15 with <i>bis</i> -bromoacetamide derivatives	310
References	312
<i>Appendix</i>	317
<i>Index</i>	323
