1. Marine biodiversity: its past development, present status, and future threats	1
<i>Stephen Widdicombe and Paul J. Somerfield</i>	
1.1 Introduction	1
1.2 What is biodiversity?	2
1.3 Comparing marine and terrestrial biodiversity	2
1.4 The rise of marine biodiversity	3
1.5 The distribution of marine biodiversity	4
1.6 Human impacts on marine biodiversity	5
1.7 The relationship between global climate and marine biodiversity	7
1.8 Could marine biodiversity be facing large-scale climate-induced extinction?	8
1.9 Additional impacts of CO ₂ on the marine environment	9
1.10 Hypoxia and 'dead zones'	11
1.11 Summary	12
2. Biodiversity in the context of ecosystem function	16
<i>Anne E. Magurran</i>	
2.1 Historical development of the concept	16
2.2 Biological diversity—meaning and measurement	17
2.3 Biodiversity in the context of function	19
2.4 Conclusions	21
3. Ecosystem function and co-evolution of terminology in marine science and management	24
<i>David M. Paterson, Emma C. Defew, and Julia Jabour</i>	
3.1 Introduction	24
3.2 What's in a name? Ecosystem function	25
3.2.1 Ecosystem function defined	25
3.3 Measuring ecosystem function	27
3.4 Ecological terms and the co-evolutionary model	29
3.5 Co-evolution, policy drivers, and opportunities	30
3.6 Conclusions	31

4. Ecological consequences of declining biodiversity: a biodiversity–ecosystem function (BEF) framework for marine systems	34
<i>Shahid Naeem</i>	
4.1 The significance of marine biological diversity	34
4.1.1 Significance	34
4.1.2 A three-point framework for marine biodiversity	35
4.2 Marine biodiversity and ecosystem function	37
4.2.1 Daunting scales	37
4.2.2 Marine biodiversity	37
4.2.3 Marine ecosystem functioning	40
4.3 Marine biotic impoverishment	41
4.4 Marine BEF findings	42
4.5 The fundamental marine BEF relationship in abstraction	43
4.5.1 Where's the inflection point?	43
4.5.2 The BEF curve for marine systems	44
4.6 Synthesis	46
4.6.1 A simple but telling marine BEF framework	46
4.6.2 Remember the humongous multipliers	47
4.6.3 Future directions	47
4.7 Conclusions	48
5. Lessons from the fossil record: the Ediacaran radiation, the Cambrian radiation, and the end-Permian mass extinction	52
<i>Stephen Q. Dornbos, Matthew E. Clapham, Margaret L. Fraiser, and Marc Laflamme</i>	
5.1 Introduction	52
5.2 Strengths and limitations of the geological record	52
5.3 Ediacaran ecosystems	54
5.3.1 Productivity–biodiversity relationship	56
5.3.2 Influence of bioturbation on ecosystem functioning	57
5.3.3 Species richness–functional diversity relationship	59
5.4 Cambrian ecosystems	60
5.4.1 Productivity–biodiversity relationship	60
5.4.2 Influence of bioturbation on ecosystem functioning	61
5.4.3 Species richness–functional diversity relationship	61
5.5 The end-Permian mass extinction and its aftermath	62
5.5.1 Environmental changes during the late Paleozoic to early Mesozoic	62
5.5.2 Permian–Triassic marine nutrient levels and primary productivity	62
5.5.3 Productivity–biodiversity–biomass relationship	64
5.5.4 Discussion	65
5.6 Conclusions	65
6. The analysis of biodiversity–ecosystem function experiments: partitioning richness and density-dependent effects	73
<i>Lisandro Benedetti-Cecchi and Elena Maggi</i>	
6.1 Introduction	73
6.2 Partitioning richness and abundance effects	75

6.3 Empirical example	77
6.3.1 Experimental layout	77
6.3.2 Fitting the mixed-effect model and evaluating contrasts	78
6.4 Results	80
6.5 Conclusions	81
7. The importance of body size, abundance, and food-web structure for ecosystem functioning	85
<i>Mark C. Emmerson</i>	
7.1 Introduction	85
7.2 Historical context and the evolution of an idea	87
7.2.1 Integrating body mass, abundance, and food-web structure into biodiversity and ecosystem functioning studies	89
7.3 The relevance of body mass to biodiversity–ecosystem functioning research	91
7.4 Abundance, body mass, and species diversity patterns	93
7.5 Conclusions	97
8. Effects of biodiversity–environment conditions on the interpretation of biodiversity–function relations	101
<i>Jasmin A. Godbold</i>	
8.1 Introduction	101
8.2 Methods of analysis	102
8.2.1 Compilation of publications	102
8.2.2 Calculation of effect sizes	103
8.2.3 Extraction of data	104
8.2.4 Statistical Analysis	104
8.3 Are alternative drivers of change more important than species richness for ecosystem properties?	105
8.3.1 Summary of studies focusing on relationship between species richness and ecosystem properties	105
8.3.2 Effects of species richness and/or additional drivers of change on ecosystem properties	107
8.3.3 Distinguishing the effects of biodiversity, the abiotic and/or biotic environment on ecosystem properties	107
8.4 Conclusions	108
9. Extending the approaches of biodiversity and ecosystem functioning to the deep ocean	115
<i>Roberto Danovaro</i>	
9.1 Deep-sea ecosystems: characteristics, biodiversity, and functioning	115
9.2 Approaches to the investigation of deep-sea biodiversity and ecosystem functioning	117
9.2.1 Biodiversity metrics	118
9.2.2 Functional diversity	118
9.2.3 Deep-sea ecosystem functioning	118
9.2.4 Variables used for measuring ecosystem efficiency	119
9.3 Relationships between biodiversity and ecosystem functioning in the deep sea	119
9.4 Relationships between biodiversity and ecosystem functioning in different deep-sea ecosystems	123
9.5 Conclusions and perspectives	124

10. Incorporating extinction risk and realistic biodiversity futures: implementation of trait-based extinction scenarios	127
<i>Martin Solan, Finlay Scott, Nicholas K. Dulvy, Jasmin A. Godbold, and Ruth Parker</i>	
10.1 Introduction	127
10.2 How to implement non-random extinction scenarios	129
10.3 Case study: implications of regional biodiversity loss on carbon cycling in the shelf sea sediments of the North Sea	133
10.3.1 Study sites and data collection	133
10.3.2 Benthic bioturbation characterization	134
10.3.3 Modelling	136
10.3.4 Estimating non-linear changes in ecosystem functioning	136
10.4 Results and discussion	136
10.5 Conclusions and recommendations	140
11. Biodiversity and ecosystem functioning: an ecosystem-level approach	149
<i>David Raffaelli and Alan M. Friedlander</i>	
11.1 The need to work at seascape scales	149
11.2 Building a credible evidence base	150
11.3 Case study 1: The Ythan estuary, Scotland	151
11.3.1 Biodiversity in the two periods	152
11.3.2 Ecological functioning in the two periods	153
11.4 Case study 2: Hawaii and the northern Line Islands, central Pacific	154
11.4.1 Hawaii	155
11.4.2 Northern Line Islands	155
11.5 Effects of fishing on fish assemblage structure	156
11.5.1 Hawaii	156
11.5.2 Northern Line Islands	157
11.6 Implications for ecosystem function	158
11.7 Conclusions	159
12. Multitrophic biodiversity and the responses of marine ecosystems to global change	164
<i>J. Emmett Duffy, John J. Stachowicz, and John F. Bruno</i>	
12.1 Introduction	164
12.2 How and why biodiversity is changing in oceans and estuaries	166
12.3 Lessons learned: different designs for different questions	174
12.4 Biodiversity and ecosystem functioning in the Anthropocene	177
13. Reality check: issues of scale and abstraction in biodiversity research, and potential solutions	185
<i>Tasman P. Crowe, Matthew E. S. Bracken, and Nessa E. O'Connor</i>	
13.1 Introduction	185
13.2 At which spatial and temporal scales have most biodiversity–ecosystem function (BEF) studies been conducted to date?	186
13.3 What important ecological processes or patterns may be lost in abstracting BEF experimental systems from natural ecosystems?	187
13.4 Does the reduced temporal/spatial scale or compromised ecological realism of marine BEF studies affect our ability to extrapolate results to other systems?	190

13.5	Relative merits of different approaches to overcoming limitations of BEF studies	192
13.5.1	Empirical research to elucidate ecological concepts	192
13.5.2	Empirical research for direct application to management/conservation	193
13.6	Conclusions	195
14.	Why bother going outside: the role of observational studies in understanding biodiversity–ecosystem function relationships	200
	<i>Simon F. Thrush and Andrew M. Lohrer</i>	
14.1	The role of observation in the design, execution, and interpretation of BEF relationships	200
14.2	The heterogeneous nature of seafloor landscapes	203
14.3	Observing the nature of functions	205
14.4	Scaling laws and relevance to BEF	207
14.5	A more integrative approach to empirical research in biodiversity–ecosystem function studies	209
15.	Implementing an ecosystem approach: predicting and safeguarding marine biodiversity futures	215
	<i>Alison R. Holt, Caroline Hattam, Stephen Mangi, Anton Edwards, and Scot Mathieson</i>	
15.1	Introduction	215
15.1.1	Taking an ecosystem approach	215
15.2	Ecosystem services, function, and biodiversity	216
15.2.1	Taking a systems perspective	219
15.2.2	Linking ecology and economics	220
15.3	An economic framework for ecosystem services	220
15.3.1	Valuation of ecosystem services	221
15.3.2	Valuation methods	222
15.4	A framework for implementing an ecosystem approach	222
15.5	Challenges for the future	229
15.5.1	Science needs	229
15.5.2	Policy needs	230
15.5.3	Conclusions	231
	Index	235
