Preface xiii

CHAPTER 1 | The Nature of Ecology 1

- 1.1 Ecology Is the Study of the Relationship between Organisms and Their Environment 2
- 1.2 Organisms Interact with the Environment in the Context of the Ecosystem 3
- 1.3 Ecological Systems Form a Hierarchy 3
- 1.4 Ecologists Study Pattern and Process at Many Levels 5
- 1.5 Ecologists Investigate Nature Using the Scientific Method 6

Quantifying Ecology 1.1 *Classifying Ecological Data* 7

- 1.6 Models Provide a Basis for Predictions 9
- 1.7 Uncertainty Is an Inherent Feature of Science 9

Quantifying Ecology 1.2 *Displaying Ecological Data: Histograms and Scatter Plots* 10

- 1.8 Ecology Has Strong Ties to Other Disciplines 12

Ecological Issues *The Human Factor* 13

- 1.9 The Individual Is the Basic Unit of Ecology 13

Summary 14

Study Questions 15

Further Readings 15

PART ONE | The Physical Environment 16

CHAPTER 2 | Climate 18

- 2.1 Earth Intercepts Solar Radiation 19
- 2.2 Intercepted Solar Radiation Varies Seasonally 21
- 2.3 Air Temperature Decreases with Altitude 23
- 2.4 Air Masses Circulate Globally 25
- 2.5 Solar Energy, Wind, and Earth's Rotation Create Ocean Currents 26
- 2.6 Temperature Influences the Moisture Content of Air 27
- 2.7 Precipitation Has a Distinctive Global Pattern 28
- 2.8 Topography Influences Regional and Local Patterns of Precipitation 30

- 2.9 Irregular Variations in Climate Occur at the Regional Scale 31
- 2.10 Most Organisms Live in Microclimates 33

Ecological Issues *Urban Microclimates* 34

Summary 35

Study Questions 36

Further Readings 36

CHAPTER 3 | The Aquatic Environment 37

- 3.1 Water Cycles between Earth and the Atmosphere 38

Ecological Issues *Groundwater Resources* 39

- 3.2 Water Has Important Physical Properties 40
- 3.3 Light Varies with Depth in Aquatic Environments 43
- 3.4 Temperature Varies with Water Depth 44
- 3.5 Water Functions as a Solvent 45
- 3.6 Oxygen Diffuses from the Atmosphere to the Surface Waters 47
- 3.7 Acidity Has a Widespread Influence on Aquatic Environments 48
- 3.8 Water Movements Shape Freshwater and Marine Environments 50
- 3.9 Tides Dominate the Marine Coastal Environment 51
- 3.10 The Transition Zone between Freshwater and Saltwater Environments Presents Unique Constraints 52

Summary 53

Study Questions 54

Further Readings 54

CHAPTER 4 | The Terrestrial Environment 55

- 4.1 Life on Land Imposes Unique Constraints 56
- 4.2 Plant Cover Influences the Vertical Distribution of Light 57

Quantifying Ecology 5.1 *Beers Law and the Attenuation of Light* 59

- 4.3 Soil Is the Foundation upon Which All Terrestrial Life Depends 60

- 4.4 The Formation of Soil Begins with Weathering 61
- 4.5 Soil Formation Involves Five Interrelated Factors 62
- 4.6 Soils Have Certain Distinguishing Physical Characteristics 63
- 4.7 The Soil Body Has Horizontal Layers, or Horizons 64
- 4.8 Moisture-Holding Capacity Is an Essential Feature of Soils 65
- 4.9 Ion Exchange Capacity Is Important to Soil Fertility 66
- 4.10 Basic Soil Formation Processes Produce Different Soils 67

Summary 69

Study Questions 70

Further Readings 71

PART TWO | The Organism and Its Environment 72

CHAPTER 5 | Ecological Genetics: Adaptation and Natural Selection 74

- 5.1 Adaptations Are a Product of Natural Selection 75
- 5.2 Genes Are the Units of Inheritance 76
- 5.3 The Phenotype Is the Physical Expression of the Genotype 76
- 5.4 Genetic Variation Occurs at the Level of the Population 77
- 5.5 Adaptation Is a Product of Evolution by Natural Selection 78
- 5.6 Several Processes Can Function to Alter Patterns of Genetic Variation 81
- 5.7 Natural Selection Can Result in Genetic Differentiation 82

Quantifying Ecology 5.1
Hardy-Weinberg Principle 83

- 5.8 Adaptations Reflect Trade-offs and Constraints 86

Field Studies
Beren Robinson 87

- 5.9 Organisms Respond to Environmental Variation at the Individual and Population Levels 91

Ecological Issues
The Ecology of Antibiotic Resistance 92

Summary 94

Study Questions 95

Further Readings 96

CHAPTER 6 | Plant Adaptations to the Environment 97

- 6.1 Photosynthesis Is the Conversion of Carbon Dioxide into Simple Sugars 98
- 6.2 The Light a Plant Receives Affects Its Photosynthetic Activity 99
- 6.3 Photosynthesis Involves Exchanges between the Plant and Atmosphere 100
- 6.4 Water Moves from the Soil, Through the Plant, to the Atmosphere 100
- 6.5 The Process of Carbon Uptake Differs for Aquatic and Terrestrial Plants 103
- 6.6 Plant Temperatures Reflect Their Energy Balance with the Surrounding Environment 104
- 6.7 Carbon Gained in Photosynthesis is Allocated to the Production of Plant Tissues 105
- 6.8 Constraints Imposed by the Physical Environment Have Resulted in a Wide Array of Plant Adaptations 106
- 6.9 Species of Plants Are Adapted to Different Light Environments 107

Quantifying Ecology 6.1
Relative Growth Rate 109

Field Studies
Kaoru Kitajima 112

- 6.10 The Link between Water Demand and Temperature Influences Plant Adaptations 114
- 6.11 Plants Vary in Their Response to Environmental Temperatures 117
- 6.12 Plants Exhibit Adaptations to Variations in Nutrient Availability 119
- 6.13 Wetland Environments Present Unique Constraints on Plant Adaptations 121

Summary 123

Study Questions 124

Further Readings 125

CHAPTER 7 | Animal Adaptations to the Environment 126

- 7.1 Size Imposes a Fundamental Constraint on the Evolution of Organisms 127
- 7.2 Animals Have Various Ways of Acquiring Energy and Nutrients 130
- 7.3 Animals Have Various Nutritional Needs 132

Field Studies
Martin Wikelski 134

- 7.4 Mineral Availability Affects Animal Growth and Reproduction 136
- 7.5 Animals Require Oxygen to Release Energy Contained in Food 136

- 7.6 Regulation of Internal Conditions Involves Homeostasis and Feedback 138
- 7.7 Animals Exchange Energy with Their Surrounding Environment 138

Quantifying Ecology 7.1

Heat Exchange and Temperature Regulation 140

- 7.8 Animals Fall into Three Groups Relative to Temperature Regulation 141
- 7.9 Poikilotherms Depend on Environmental Temperatures 142
- 7.10 Homeotherms Escape the Thermal Restraints of the Environment 143
- 7.11 Endothermy and Ectothermy Involve Trade-offs 145
- 7.12 Heterotherms Take on Characteristics of Ectotherms and Endotherms 146
- 7.13 Torpor Helps Some Animals Conserve Energy 147
- 7.14 Some Animals Use Unique Physiological Means for Thermal Balance 147
- 7.15 Maintenance of Water Balance for Terrestrial Animals Is Constrained by Uptake and Conservation 148
- 7.16 Animals of Aquatic Environments Face Unique Problems in Maintaining Water Balance 149
- 7.17 Buoyancy Helps Aquatic Organisms to Stay Afloat 150
- 7.18 Daily and Seasonal Light and Dark Cycles Influence Animal Activity 151
- 7.19 Critical Day Lengths Trigger Seasonal Responses 152
- 7.20 Activity Rhythms of Intertidal Organisms Follow Tidal Cycles 153

Summary 154

Study Questions 156

Further Readings 156

CHAPTER 8 | Life History Patterns 158

- 8.1 Reproduction May Be Sexual or Asexual 159
- 8.2 Sexual Reproduction Takes a Variety of Forms 160
- 8.3 Mating Systems Describe the Pairing of Males and Females 162
- 8.4 Acquisition of a Mate Involves Sexual Selection 163

Field Studies

Alexandra L. Basolo 164

- 8.5 Females May Acquire Mates Based on Resources 166
- 8.6 Organisms Budget Time and Energy to Reproduction 167

Quantifying Ecology 8.1

Interpreting Trade-offs 168

- 8.7 Species Differ in the Timing of Reproduction 168
- 8.8 Parental Investment Depends on the Number and Size of Young 170
- 8.9 Fecundity Depends on Age and Size 170
- 8.10 Food Supply Affects the Production of Young 171
- 8.11 Reproductive Effort May Vary with Latitude 172
- 8.12 Habitat Selection Influences Reproductive Success 173
- 8.13 Environmental Conditions Influence the Evolution of Life History Characteristics 174

Ecological Issues

The Life History of Maize: A Story of Unnatural Selection 175

Summary 177

Study Questions 178

Further Readings 179

PART THREE | Populations 180

CHAPTER 9 | Properties of Populations 182

- 9.1 Organisms May Be Unitary or Modular 183
- 9.2 The Distribution of a Population Defines Its Spatial Location 183
- 9.3 Abundance Reflects Both the Population Density and Distribution 186
- 9.4 Determining Density Requires Sampling 188
- 9.5 Populations Have Age Structures 189
- 9.6 Sex Ratios in Populations May Shift with Age 191
- 9.7 Individuals Move Within the Population 192
- 9.8 Population Distribution and Density Change in Both Time and Space 194

Ecological Issues

Human-Assisted Dispersal 195

Summary 196

Study Questions 197

Further Readings 197

CHAPTER 10 | Population Growth 199

- 10.1 Population Growth Reflects the Difference between Rates of Birth and Death 200

Quantifying Ecology 10.1

Derivatives and Differential Equations 201

Quantifying Ecology 10.2

Exponential Model of Population Growth 202

- 10.2 Life Tables Provide a Schedule of Age-Specific Mortality and Survival 204

Quantifying Ecology 10.3

Life Expectancy 205

- 10.3 Different Types of Life Tables Reflect Different Approaches to Defining Cohorts and Age Structure 205
- 10.4 Life Tables Provide Data for Mortality and Survivorship Curves 206
- 10.5 Birthrate Is Age-Specific 208
- 10.6 Birthrate and Survivorship Determine Net Reproductive Rate 208
- 10.7 Age-Specific Mortality and Birthrates Can Be Used to Project Population Growth 209
- 10.8 Stochastic Processes Can Influence Population Dynamics 211
- 10.9 A Variety of Factors Can Lead to Population Extinction 212
- 10.10 Small Populations Are Susceptible to Extinction 213

Summary 214

Study Questions 215

Further Readings 215

CHAPTER 11 | Intraspecific Population Regulation 216

- 11.1 The Environment Functions to Limit Population Growth 217

Quantifying Ecology 11.1

The Logistic Model of Population Growth 218

Ecological Issues

The Human Carrying Capacity 219

- 11.2 Population Regulation Involves Density Dependence 220
- 11.3 Competition Results When Resources Are Limited 222
- 11.4 Intraspecific Competition Affects Growth and Development 222
- 11.5 Intraspecific Competition Can Influence Mortality Rates 224
- 11.6 Intraspecific Competition Can Reduce Reproduction 226
- 11.7 High Density Is Stressful to Individuals 227
- 11.8 Dispersal Can Be Density-Dependent 229
- 11.9 Social Behavior May Function to Limit Populations 229

Field Studies

T. Scott Sillett 230

- 11.10 Territoriality Can Function to Regulate Population Growth 232
- 11.11 Plants Preempt Space and Resources 234
- 11.12 Density-Independent Factors Can Influence Population Growth 234

Summary 235

Study Questions 236

Further Readings 237

CHAPTER 12 | Metapopulations 238

- 12.1 Four Conditions Define a Metapopulation 240
- 12.2 Metapopulation Dynamics Is a Balance between Colonization and Extinction 241

Quantifying Ecology 12.1

Equilibrium Proportion of Occupied Patches 242

Ecological Issues

The Metapopulation Concept in Conservation Ecology 243

- 12.3 Patch Area and Isolation Influence Metapopulation Dynamics 244
- 12.4 Habitat Heterogeneity Influences Local Population Persistence 247
- 12.5 Some Habitat Patches May Function as the Major Source of Emigrants 248
- 12.6 Certain Factors Can Function to Synchronize the Dynamics of Local Populations 248
- 12.7 Species Differ in Their Potential Rates of Colonization and Extinction 249
- 12.8 The Concept of Population Is Best Approached by Using a Hierarchical Framework 250

Summary 251

Study Questions 252

Further Readings 253

PART FOUR | Species Interactions 254

CHAPTER 13 | Interspecific Competition 256

- 13.1 Interspecific Competition Involves Two or More Species 257
- 13.2 There Are Four Possible Outcomes of Interspecific Competition 257

Quantifying Ecology 13.1

Interpreting Population Isoclines 260

- 13.3 Laboratory Experiments Support the Lotka–Volterra Equations 260

- 13.4 Studies Support the Competitive Exclusion Principle 261
- 13.5 Competition Is Influenced by Nonresource Factors 262
- 13.6 Temporal Variation in the Environment Influences Competitive Interactions 262
- 13.7 Competition Occurs for Multiple Resources 263

Field Studies

Katherine N. Suding 264

- 13.8 Relative Competitive Abilities Change along Environmental Gradients 266

Quantifying Ecology 13.2

Competition under Changing Environmental Conditions: Application of the Lotka–Volterra Model 267

- 13.9 Interspecific Competition Influences the Niche of a Species 270
- 13.10 Coexistence of Species Often Involves Partitioning Available Resources 273
- 13.11 Competition Can Influence Natural Selection 275
- 13.12 Competition Is a Complex Interaction Involving Biotic and Abiotic Factors 278

Summary 278

Study Questions 279

Further Readings 280

CHAPTER 14 | Predation 281

- 14.1 Predation Takes a Variety of Forms 282
- 14.2 Mathematical Model Describes the Basics of Predation 282
- 14.3 Model Suggests Mutual Population Regulation 285
- 14.4 Functional Responses Relate Prey Consumed to Prey Density 285
- 14.5 Predators Respond Numerically to Changing Prey Density 288
- 14.6 Foraging Involves Decisions about the Allocation of Time and Energy 290
- 14.7 Foragers Seek Productive Food Patches 291
- 14.8 Risk of Predation Can Influence Foraging Behavior 291

Quantifying Ecology 14.1

A Simple Model of Optimal Foraging 293

- 14.9 Coevolution Can Occur between Predator and Prey 294
- 14.10 Animal Prey Have Evolved Defenses against Predators 294
- 14.11 Predators Have Evolved Efficient Hunting Tactics 298

- 14.12 Herbivores Prey on Autotrophs 298

Field Studies

Rick A. Relyea 300

- 14.13 Plants Have Evolved Characteristics That Deter Herbivores 302
- 14.14 Plants, Herbivores, and Carnivores Interact 303
- 14.15 Predators Influence Prey Dynamics through Lethal and Nonlethal Effects 304

Summary 305

Study Questions 307

Further Readings 307

CHAPTER 15 | Parasitism and Mutualism 308

- 15.1 Parasites Draw Resources from Host Organisms 309
- 15.2 Hosts Provide Diverse Habitats for Parasites 310
- 15.3 Direct Transmission Can Occur between Host Organisms 310
- 15.4 Transmission between Hosts Can Involve an Intermediate Vector 311
- 15.5 Transmission Can Involve Multiple Hosts and Stages 311
- 15.6 Hosts Respond to Parasitic Invasions 312
- 15.7 Parasites Can Affect Host Survival and Reproduction 313
- 15.8 Parasites May Regulate Host Populations 314

Ecological Issues

Plagues Upon Us 315

- 15.9 Parasitism Can Evolve into a Mutually Beneficial Relationship 316
- 15.10 Mutualisms Involve Diverse Species Interactions 317

Field Studies

John J. Stachowicz 318

- 15.11 Mutualisms Are Involved in the Transfer of Nutrients 320
- 15.12 Some Mutualisms Are Defensive 322
- 15.13 Mutualisms Are Often Necessary for Pollination 323
- 15.14 Mutualisms Are Involved in Seed Dispersal 324
- 15.15 Mutualisms Can Influence Population Dynamics 325

Quantifying Ecology 15.1

A Model of Mutualistic Interactions 326

Summary 327

Study Questions 329

Further Readings 329

PART SIX | Ecosystem Ecology 412

CHAPTER 20 | Ecosystem Energetics 414

- 20.1 The Laws of Thermodynamics Govern Energy Flow 415
- 20.2 Energy Fixed in the Process of Photosynthesis Is Primary Production 415
- 20.3 Temperature, Water, and Nutrients Control Primary Production in Terrestrial Ecosystems 416
- 20.4 Temperature, Light, and Nutrients Control Primary Production in Aquatic Ecosystems 420
- 20.5 Energy Allocation and Plant Life-Form Influence Primary Production 421
- 20.6 Primary Production Varies with Time 423
- 20.7 Primary Productivity Limits Secondary Production 424
- 20.8 Consumers Vary in Efficiency of Production 426
- 20.9 Ecosystems Have Two Major Food Chains 427

Ecological Issues

Human Appropriation of Net Primary Productivity 428

- 20.10 Energy Flows through Trophic Levels Can Be Quantified 428
- 20.11 Consumption Efficiency Determines the Pathway of Energy Flow through the Ecosystem 430
- 20.12 Energy Decreases in Each Successive Trophic Level 431

Field Studies

Brian Silliman 432

Summary 435

Study Questions 436

Further Readings 437

CHAPTER 21 | Decomposition and Nutrient Cycling 438

- 21.1 Most Essential Nutrients Are Recycled Within the Ecosystem 439
- 21.2 Decomposition Is a Complex Process Involving a Variety of Organisms 440
- 21.3 Studying Decomposition Involves Following the Fate of Dead Organic Matter 442

Quantifying Ecology 21.1

Estimating the Rate of Decomposition 443

- 21.4 Several Factors Influence the Rate of Decomposition 444
- 21.5 Nutrients in Organic Matter Are Mineralized During Decomposition 446

Field Studies

Edward A. G. (Ted) Schuur 447

- 21.6 Decomposition Proceeds as Plant Litter Is Converted into Soil Organic Matter 451
- 21.7 Plant Processes Enhance the Decomposition of Soil Organic Matter in the Rhizosphere 453
- 21.8 Decomposition Occurs in Aquatic Environments 456
- 21.9 Key Ecosystem Processes Influence the Rate of Nutrient Cycling 456

Ecological Issues

Nitrogen Fertilizers 457

- 21.10 Nutrient Cycling Differs between Terrestrial and Open-Water Aquatic Ecosystems 459
- 21.11 Water Flow Influences Nutrient Cycling in Streams and Rivers 460
- 21.12 Land and Marine Environments Influence Nutrient Cycling in Coastal Ecosystems 462
- 21.13 Surface Ocean Currents Bring About Vertical Transport of Nutrients 463

Summary 464

Study Questions 466

Further Readings 466

CHAPTER 22 | Biogeochemical Cycles 467

- 22.1 There Are Two Major Types of Biogeochemical Cycles 468
- 22.2 Nutrients Enter the Ecosystem via Inputs 468
- 22.3 Outputs Represent a Loss of Nutrients from the Ecosystem 469
- 22.4 Biogeochemical Cycles Can Be Viewed from a Global Perspective 470
- 22.5 The Carbon Cycle Is Closely Tied to Energy Flow 470
- 22.6 Carbon Cycling Varies Daily and Seasonally 471
- 22.7 The Global Carbon Cycle Involves Exchanges among the Atmosphere, Oceans, and Land 472
- 22.8 The Nitrogen Cycle Begins with Fixing Atmospheric Nitrogen 473
- 22.9 The Phosphorus Cycle Has No Atmospheric Pool 477

Ecological Issues

Nitrogen Saturation 478

- 22.10 The Sulfur Cycle Is Both Sedimentary and Gaseous 480
- 22.11 The Global Sulfur Cycle Is Poorly Understood 481
- 22.12 The Oxygen Cycle Is Largely under Biological Control 482

- 22.13 The Various Biogeochemical Cycles
Are Linked 483

Summary 483

Study Questions 485

Further Readings 485

PART SEVEN | Ecological Biogeography 486

CHAPTER 23 | Terrestrial Ecosystems 488

- 23.1 Terrestrial Ecosystems Reflect Adaptations of
the Dominant Plant Life-Forms 490

Quantifying Ecology 23.1
Climate Diagrams 492

- 23.2 Tropical Forests Characterize the
Equatorial Zone 493
- 23.3 Tropical Savannas Are Characteristic of
Semiarid Regions with Seasonal Rainfall 496
- 23.4 Grassland Ecosystems of the Temperate Zone
Vary with Climate and Geography 498
- 23.5 Deserts Represent a Diverse Group of
Ecosystems 501
- 23.6 Mediterranean Climates Support Temperate
Shrublands 504
- 23.7 Forest Ecosystems Dominate the Wetter Regions
of the Temperate Zone 507
- 23.8 Conifer Forests Dominate the Cool Temperate
and Boreal Zones 509
- 23.9 Low Precipitation and Cold Temperatures Define
the Arctic Tundra 511

Summary 514

Study Questions 515

Further Readings 516

CHAPTER 24 | Aquatic Ecosystems 517

- 24.1 Lakes Have Many Origins 518
- 24.2 Lakes Have Well-Defined Physical
Characteristics 518

Ecological Issues
*Dams Regulating the Flow of
River Ecosystems* 520

- 24.3 The Nature of Life Varies in the
Different Zones 520
- 24.4 The Character of a Lake Reflects Its
Surrounding Landscape 523
- 24.5 Flowing-Water Ecosystems Vary in Structure and
Types of Habitats 524

Quantifying Ecology 24.1
Streamflow 526

- 24.6 Life Is Highly Adapted to Flowing Water 526
- 24.7 The Flowing-Water Ecosystem Is a Continuum
of Changing Environments 529
- 24.8 Rivers Flow into the Sea, Forming
Estuaries 530
- 24.9 Oceans Exhibit Zonation and Stratification 531
- 24.10 Pelagic Communities Vary Among the
Vertical Zones 532
- 24.11 Benthos Is a World of Its Own 534
- 24.12 Coral Reefs Are Complex Ecosystems Built by
Colonies of Coral Animals 535
- 24.13 Productivity of the Oceans Is Governed by Light
and Nutrients 536

Summary 537

Study Questions 539

Further Readings 539

CHAPTER 25 | Coastal and Wetland Ecosystems 540

- 25.1 The Intertidal Zone Is the Transition Between
Terrestrial and Marine Environments 541
- 25.2 Rocky Shorelines Have a Distinct Pattern of
Zonation 541
- 25.3 Sandy and Muddy Shores Are Harsh
Environments 543
- 25.4 Tides and Salinity Dictate the Structure of
Salt Marshes 544
- 25.5 Mangroves Replace Salt Marshes in
Tropical Regions 546
- 25.6 Freshwater Wetlands Are A Diverse
Group of Ecosystems 547
- 25.7 Hydrology Defines the Structure of
Freshwater Wetlands 549

Ecological Issues
The Continuing Decline of the Wetlands 552

- 25.8 Freshwater Wetlands Support a Rich Diversity
of Life 554

Summary 554

Study Questions 555

Further Readings 555

CHAPTER 26 | Large-Scale Patterns of Biological Diversity 556

- 26.1 Earth's Biological Diversity Has Changed
through Geologic Time 557
- 26.2 Past Extinctions Have Been Clustered
in Time 558

CHAPTER 16 | Community Structure 332

- 16.1 The Number of Species and Their Relative Abundance Define Diversity 333
- 16.2 Numerical Supremacy Defines Dominance 335
- 16.3 Keystone Species Influence Community Structure Disproportionately to Their Numbers 336
- 16.4 Food Webs Describe Species Interactions 336
- 16.5 Species within a Community Can Be Classified into Functional Groups 338
- 16.6 Communities Have a Characteristic Physical Structure 338
- 16.7 Zonation Is Spatial Change in Community Structure 340
- 16.8 Defining Boundaries between Communities Is Often Difficult 342
- 16.9 Two Contrasting Views of the Community 343

Quantifying Ecology 16.1
Community Similarity 346

Summary 347

Study Questions 347

Further Readings 348

CHAPTER 17 | Factors Influencing the Structure of Communities 349

- 17.1 The Fundamental Niche Constrains Community Structure 350
- 17.2 Species Interactions Are Diffuse 351

Field Studies
Sally D. Hacker 352

Quantifying Ecology 17.1
Quantifying the Structure of Food Webs: Connectance 355

- 17.3 Food Webs Illustrate Indirect Interactions 356
- 17.4 Food Webs Suggest Controls of Community Structure 358
- 17.5 Species Interactions along Environmental Gradients Involve Both Stress Tolerance and Competition 360
- 17.6 Environmental Heterogeneity Influences Community Diversity 363
- 17.7 Resource Availability Can Influence Plant Diversity within a Community 364

Summary 366

Study Questions 367

Further Readings 367

- 18.1 Community Structure Changes Through Time 369

Ecological Issues
American Forests 370

- 18.2 Primary Succession Occurs on Newly Exposed Substrates 373
- 18.3 Secondary Succession Occurs After Disturbances 374
- 18.4 The Study of Succession Has a Rich History 375
- 18.5 Succession Is Associated with Autogenic Changes in Environmental Conditions 377
- 18.6 Species Diversity Changes During Succession 379
- 18.7 Succession Involves Heterotrophic Species 381
- 18.8 Systematic Changes in Community Structure Are a Result of Allogenic Environmental Change at a Variety of Timescales 382
- 18.9 Community Structure Changes Over Geologic Time 383
- 18.10 The Concept of Community Revisited 384

Summary 388

Study Questions 389

Further Readings 390

CHAPTER 19 | Landscape Ecology 391

- 19.1 Environmental Processes Create a Variety of Patches in the Landscape 393
- 19.2 Transition Zones Offer Diverse Conditions and Habitats 394
- 19.3 Patch Size and Shape Are Crucial to Species Diversity 397
- 19.4 The Theory of Island Biogeography Applies to Landscape Patches 399
- 19.5 Corridors Permit Movement between Patches 401

Field Studies
Nick M. Haddad 402

- 19.6 The Metapopulation Is a Central Concept in the Study of Landscape Dynamics 404
- 19.7 Frequency, Intensity, and Scale Determine the Impact of Disturbances 405
- 19.8 Various Natural Processes Function as Disturbances 405
- 19.9 Human Disturbance Creates Some of the Most Long-Lasting Effects 408
- 19.10 The Landscape Represents a Shifting Mosaic of Changing Communities 408

Summary 409

Study Questions 410

Further Readings 411

- 26.3 Regional and Global Patterns of Species Diversity Vary Geographically 559
- 26.4 Species Richness in Terrestrial Ecosystems Correlates with Climate and Productivity 560
- 26.5 In Marine Environments, There Is an Inverse Relationship between Productivity and Diversity 562
- 26.6 Species Diversity Is a Function of Processes Operating at Many Scales 563

Quantifying Ecology 26.1

Quantifying Biodiversity: Comparing Species Richness Using Rarefaction Curves 564

Summary 566

Study Questions 566

Further Readings 567

PART EIGHT | Human Ecology 568

CHAPTER 27 | Population Growth, Resource Use, and Sustainability 570

- 27.1 Sustainable Resource Use Is a Balance between Supply and Demand 572
- 27.2 Sustainability Can Be Indirectly Limited by Adverse Consequences of Resource Use 574
- 27.3 Sustainability Is a Concept Learned from Natural Ecosystems 574
- 27.4 Agricultural Practices Vary in the Level of Energy Input 575
- 27.5 Swidden Agriculture Represents a Dominant Form of Agriculture in the Wet Tropics 575
- 27.6 Industrialized Agriculture Dominates the Temperate Zone 576
- 27.7 Different Agricultural Methods Represent a Trade-off between Sustainability and Productivity 578
- 27.8 Sustainable Agriculture Depends on a Variety of Methods 580

Ecological Issues

Genetically Modified Crops 581

- 27.9 The Goal of Sustainable Forestry Is to Achieve a Balance between Net Growth and Harvest 582

Field Studies

Deborah Lawrence 585

- 27.10 Exploitation of Fisheries Has Lead to the Need for Management 588
- 27.11 Fisheries Management Requires an Ecosystem Approach 589

- 27.12 Economics Are a Key Factor Governing Resource Management 593

Summary 594

Study Questions 596

Further Readings 596

CHAPTER 28 | Habitat Loss, Biodiversity, and Conservation 598

- 28.1 The Destruction of Habitat is the Leading Cause of Current Species Extinctions 599
- 28.2 Human-Introduced Exotic Species Pose a Threat to Many Native Species 602
- 28.3 Species Differ in Their Susceptibility to Extinction 604
- 28.4 The Identification of Threatened Species Is Critical to Conservation Efforts 605

Ecological Issues

The Wolves of Yellowstone National Park 606

Quantifying Ecology 28.1

Effective Population Size 607

- 28.5 Regions of High Species Diversity Are Crucial to Conservation Efforts 607
- 28.6 Protecting Populations Is the Key To Conservation Efforts 609
- 28.7 Reintroduction Is Necessary to Reestablish Populations of Some Species 611
- 28.8 Habitat Conservation Functions to Protect Whole Communities 612
- 28.9 Habitat Conservation Involves Establishing Protected Areas 614
- 28.10 Habitat Restoration Is Often Necessary in Conservation Efforts 617
- 28.11 Environmental Ethics Is at the Core of Conservation 618

Summary 619

Study Questions 620

Further Readings 620

CHAPTER 29 | Global Climate Change 622

- 29.1 Greenhouse Gases Influence Earth's Energy Balance, and Climate 623
- 29.2 Atmospheric Concentration of Carbon Dioxide Is Rising 623
- 29.3 Tracking the Fate of CO₂ Emissions 624
- 29.4 Atmospheric CO₂ Concentrations Affect CO₂ Uptake by Oceans 626
- 29.5 Plants Respond to Increased Atmospheric CO₂ 627

Field Studies

Erika Zavaleta 628

- 29.6 Greenhouse Gases Are Changing the Global Climate 631
- 29.7 Changes in Climate Will Affect Ecosystems at Many Levels 633

Ecological Issues

Who Turned Up the Heat? 638

- 29.8 Changing Climate Will Shift the Global Distribution of Ecosystems 640
- 29.9 Global Warming Would Raise Sea Level and Affect Coastal Environments 641
- 29.10 Climate Change Will Affect Agricultural Production 642

- 29.11 Climate Change Will Directly and Indirectly Affect Human Health 644

- 29.12 Understanding Global Change Requires the Study of Ecology at a Global Scale 646
