1 Introduction

1

Banafshé Larijani, Colin. A. Rosser and Rudiger Woscholski

- 1.1 Chemical biology – the present 1
- 1.2 Chemical biology – the past 2
- 1.3 Chemical biology – the future 3
- 1.4 Chemical biology – mind the interdisciplinary gap 4
- 1.5 An introduction to the following chapters 5
 - 1.5.1 Cryo-electron microscopy 5
 - 1.5.2 Atomic force microscopy 5
 - 1.5.3 Differential scanning calorimetry in the study of lipid structures 6
 - 1.5.4 Membrane potentials and membrane probes 6
 - 1.5.5 Identification and quantification of lipids using mass spectroscopy 7
 - 1.5.6 Liquid-state NMR 7
 - 1.5.7 Solid-state NMR in biomembranes 7
 - 1.5.8 Molecular dynamics 8
 - 1.5.9 Two-dimensional infrared studies of biomolecules 8
 - 1.5.10 Biological applications of single and two-photon fluorescence 8
 - 1.5.11 Optical tweezers 9
 - 1.5.12 PET imaging in chemical biology 9
 - 1.5.13 Chemical genetics 9

2 Cryomicroscopy

11

Frank Booy and Elena Orlova

- 2.1 The need for (electron) microscopy 11
- 2.2 Development of cryomicroscopy 11
- 2.3 Sample–electron interaction 13
- 2.4 Contrast in negatively stained and cryo preparations 14
- 2.5 Image formation 16
- 2.6 Image analysis 16
- 2.7 Software used in the analysis of electron micrographs 19

2.8	Examples	21
2.8.1	Two-dimensional crystals	21
2.8.2	Helical structures	21
2.8.3	Single particles with low symmetry	24
2.8.4	Cellular tomography	24
2.9	Conclusions	27
3	Atomic force microscopy: applications in biology	29
	<i>James Moody and Stephanie Allen</i>	
3.1	A brief history of microscopy	29
3.2	The scanning probe microscope revolution	30
3.2.1	The stylus profiler	30
3.2.2	The scanning tunnelling microscope	30
3.2.3	The atomic force microscope	31
3.3	The workings of an AFM instrument	31
3.3.1	The imaging probe	31
3.3.2	The piezoelectric scanner	32
3.3.3	The deflection detection system	33
3.3.4	The electronic feedback system	34
3.4	Imaging biological molecules with force	34
3.4.1	Contact mode	35
3.4.2	Oscillating cantilever imaging modes	36
3.4.3	Imaging in liquid	38
3.5	Factors influencing image quality	38
3.5.1	Sample preparation and immobilization	38
3.5.2	Tip convolution/broadening	39
3.5.3	Double tipping	40
3.5.4	Sample roughness	41
3.5.5	Temperature variation and vibration isolation	41
3.6	Biological applications of AFM and recent developments	42
3.6.1	Imaging dynamic processes	42
3.6.2	Measuring biomolecular forces	43
3.7	Conclusions and future directions	45
4	Differential scanning calorimetry in the study of lipid structures	47
	<i>Félix M. Goñi and Alicia Alonso</i>	
4.1	Introduction	47
4.2	Membranes, lipids and lipid phases	47
4.3	Heat exchanges and calorimetry	50
4.3.1	Heat and related entities	50
4.3.2	Differential scanning calorimetry	52
4.4	Phase transitions in pure lipid-water systems	53
4.4.1	Gel ($L_{\beta'}$) to rippled ($P_{\beta'}$) phase transition (the 'pre-transition')	53
4.4.2	Rippled ($P_{\beta'}$) to liquid-crystalline (L_{α}) phase transition	54
4.4.3	Gel (L_{β}) to liquid-crystalline (L_{α}) phase transition	55
4.4.4	Lamellar (L_{α}) to inverted hexagonal (H_{II}) phase transition	55
4.5	Selected examples of transitions in lipid mixtures	55
4.5.1	Phospholipid-cholesterol mixtures	57
4.5.2	Lamellar-to-inverted hexagonal transitions	60
4.6	Complex systems: lipid-protein mixtures and cell membranes	62

4.6.1	Lipid-protein systems	62
4.6.2	Cell membranes and cell walls	64
4.7	Conclusion	65
5	Membrane potentials and membrane probes	67
	<i>Paul O'Shea</i>	
5.1	Introduction: biological membranes; structure and electrical properties	67
5.2	Phospholipid membranes as molecular environments	68
5.3	The physical origins of the transmembrane (V_m or $\Delta\psi$) surface (ϕ_s) and dipolar (ϕ_D) membrane potentials	69
5.3.1	The transmembrane potential difference (V_m or $\Delta\psi$)	69
5.3.2	The membrane surface potential (ϕ_s)	71
5.3.3	The membrane dipole potential (ϕ_d)	73
5.4	Measurement of membrane potentials	74
5.4.1	Electrodes	74
5.4.2	Spectroscopic measurements of the transmembrane potential difference	77
5.4.3	Spectroscopic measurements of the membrane surface potential	78
5.4.4	Spectroscopic measurements of the membrane dipole potential	79
5.5	Problems with spectroscopic measurements of membrane potentials	82
5.6	Spatial imaging of membrane potentials	82
6	Identification and quantification of lipids using mass spectrometry	85
	<i>Trevor R. Pettitt and Michael J. O. Wakelam</i>	
6.1	Introduction	85
6.2	Lipid analysis by mass spectrometry	86
6.2.1	HPLC-ESI-MS	88
6.2.2	Tandem mass spectrometry	91
6.3	Conclusion	93
7	Liquid-state NMR	95
	<i>Charlie Dickinson</i>	
7.1	Introduction	95
7.2	How NMR works: the basics	96
7.3	Some NMR applications in biology	100
7.3.1	<i>In vivo</i> cell metabolism made 'visible' by NMR	100
7.3.2	<i>In vivo</i> phosphorus and nitrogen metabolism	101
7.3.3	Identification and quantification of small quantities in a complex mixture by 2D ^1H - ^{31}P -HMQC-TOCSY NMR	104
7.3.4	Simultaneous separation and identification of very complex mixtures: LC-NMR	106
7.3.5	Three-dimensional molecular structures in solution	108
7.4	Conclusion	111
8	Solid-state NMR in biomembranes	113
	<i>Erick J. Dufourc</i>	
8.1	Introduction	113
8.2	NMR basics for membrane systems	114
8.2.1	Anisotropy of NMR interactions in membranes	114
8.2.2	Spectra and the effect of motional averages	116

8.2.3	A special case of motional averaging: magic angle sample spinning	118
8.2.4	Relaxations times: measuring dynamics	118
8.3	Applications of wide-line NMR to membrane systems	119
8.3.1	Lipid phases: diagrams, peptide-induced fusion-fragmentation	120
8.3.2	Bilayer internal dynamics: order parameters, membrane thickness, sterols	121
8.3.3	Orientation of molecules (sterols, helical peptides) in membranes	124
8.3.4	Membrane dynamics from picoseconds to milliseconds	124
8.4	Applications of MAS to biomembranes and natural colloids	126
8.4.1	Three-dimensional structure of peptides in membranes	126
8.4.2	Three-dimensional structure of wine tannin-salivary protein colloidal complexes	128
8.4.3	Distance determination using MAS recoupling techniques	128
8.5	Conclusion	128
9	Molecular dynamics	133
	<i>Michel Laguerre</i>	
9.1	Introduction	133
9.2	The basis of molecular mechanics	133
9.2.1	Force fields	134
9.2.2	The energy problem	135
9.3	The basis of molecular dynamics	137
9.3.1	Influence of temperature	138
9.4	Factors affecting the length of simulations	139
9.5	Problems caused by solvents	140
9.6	How to build a lipid bilayer for simulation purposes	142
9.7	Special case of membrane proteins	146
9.8	Summary	149
10	Two-dimensional infrared studies of biomolecules	151
	<i>Xabier Coto, Ibón Iloro and José Luis R. Arrondo</i>	
10.1	Introduction	151
10.2	Description of the technique	152
10.3	Spectral simulations	152
10.3.1	Intensity changes	154
10.3.2	Band shifting	156
10.3.3	Bandwidth	157
10.4	Two-dimensional studies of human lipoproteins	158
10.5	Summary	161
11	Biological applications of single- and two-photon fluorescence	163
	<i>Banafshe Larijani and Angus Bain</i>	
11.1	Introduction	163
11.2	Basic principles of fluorescence	163
11.3	Main principles of RET via single-photon excitation	164
11.4	Detection of RET	165
11.4.1	Steady-state method	165
11.4.2	Time-resolved method	166
11.5	Biological examples of RET monitored by frequency-domain FLIM	168
11.6	Two-photon fluorescence	171
11.6.1	Basic concepts	171

11.6.2	Two-photon fluorescence	174
11.7	Applications of two-photon fluorescence	178
11.7.1	Two-photon fluorescence imaging	178
11.7.2	Biological example – two-photon time-domain FLIM	184
11.8	Photoselection and fluorescence anisotropy	185
11.9	Fluorescence anisotropy and isotropic rotational diffusion	185
11.10	Fluorescent probes in proteins and membranes	188
11.10.1	Ordered molecular systems	190
11.11	Future developments	193
11.11.1	New chromophores for two-photon fluorescence	193
11.11.2	Stimulated emission depletion in two-photon excited states	193
11.12	Conclusions	196
12	Optical tweezers	199
	<i>Christopher Batters and Justin E. Molloy</i>	
12.1	Introduction	199
12.1.1	History of optical tweezers	199
12.1.2	Single-molecule studies	200
12.2	Theoretical background	201
12.3	Apparatus	203
12.3.1	Building an optical tweezers transducer	203
12.3.2	Creating multiple laser traps: acousto-optical deflectors	204
12.3.3	Camera and light path	206
12.4	Data collection and analysis	207
12.4.1	Collecting data with an optical tweezer	207
12.4.2	Calibration of the detectors and of the optical tweezer stiffness	208
12.4.3	Stokes calibration	208
12.4.4	Equipartition principle	208
12.5	A biological application	209
12.5.1	Studying acto-myosin interactions	209
12.5.2	Identification of events and data analysis	211
12.5.3	Measuring the powerstroke	211
12.5.4	Lifetime analysis	213
12.6	Other biological examples	214
12.7	Summary	216
13	PET imaging in chemical biology	217
	<i>Ramón Vilar</i>	
13.1	Introduction	217
13.2	Positron emission tomography: principles and instrumentation	218
13.3	Applications of PET imaging in the biomedical sciences	220
13.3.1	A labelled glucose analogue: an indirect probe to measure energy metabolism	221
13.3.2	Imaging dopamine metabolism with PET	222
13.3.3	PET imaging in gene expression	224
13.3.4	Molecular imaging in drug discovery and development	226
13.4	Conclusions and outlook	228
14	Chemical genetics	231
	<i>Piers Gaffney</i>	
14.1	Introduction	231

14.2 Why chemicals?	232
14.3 Chemical genetics – why now?	233
14.4 The relationship between classical genetics and chemical genetics	234
14.5 Forward chemical genetics	235
14.5.1 Obtain a compound library	236
14.5.2 Screening	242
14.5.3 Target identification	244
14.6 Reverse chemical genetics	245
14.7 Closing remarks	247
