

CONTENTS

PREFACE	v
THERMODYNAMICS	1
1. Heat, Work, and Energy	3
1.1 Introduction	3
1.2 Temperature	4
1.3 Heat	5
1.4 Work	6
1.5 Definition of Energy	9
1.6 Enthalpy	11
1.7 Standard States	12
1.8 Calorimetry	13
1.9 Reaction Enthalpies	16
1.10 Temperature Dependence of the Reaction Enthalpy	18
References	19
Problems	20
2. Entropy and Free Energy	22
2.1 Introduction	22
2.2 Statement of the Second Law	23
2.3 Calculation of the Entropy	25
2.4 Third Law of Thermodynamics	27
2.5 Molecular Interpretation of Entropy	28
2.6 Free Energy	29
2.7 Chemical Equilibria	31
2.8 Pressure and Temperature Dependence of the Free Energy	34
2.9 Phase Changes	36
2.10 Additions to the Free Energy	38
Problems	39

3. Applications of Thermodynamics to Biological Systems	42
3.1 Biochemical Reactions	42
3.2 Metabolic Cycles	44
3.3 Direct Synthesis of ATP	48
3.4 Establishment of Membrane Ion Gradients by Chemical Reactions	49
3.5 Protein Structure	51
3.6 Protein Folding	57
3.7 Nucleic Acid Structures	60
3.8 DNA Melting	63
3.9 RNA	67
References	68
Problems	69
 CHEMICAL KINETICS	 73
4. Principles of Chemical Kinetics	75
4.1 Introduction	75
4.2 Reaction Rates	77
4.3 Determination of Rate Laws	79
4.4 Radioactive Decay	82
4.5 Reaction Mechanisms	83
4.6 Temperature Dependence of Rate Constants	86
4.7 Relationship between Thermodynamics and Kinetics	90
4.8 Reaction Rates Near Equilibrium	91
References	94
Problems	94
 5. Applications of Kinetics to Biological Systems	 97
5.1 Introduction	97
5.2 Enzyme Catalysis: The Michaelis–Menten Mechanism	97
5.3 α -Chymotrypsin	102
5.4 Protein Tyrosine Phosphatase	109
5.5 Ribozymes	112
5.6 DNA Melting and Renaturation	116
References	122
Problems	123
 SPECTROSCOPY	 127
6. Fundamentals of Spectroscopy	129
6.1 Introduction	129
6.2 Quantum Mechanics	130

6.3	Particle in a Box	133
6.4	Properties of Waves	137
	References	141
	Problems	141
7.	X-ray Crystallography	143
7.1	Introduction	143
7.2	Scattering of X rays by a Crystal	144
7.3	Structure Determination	146
7.4	Neutron Diffraction	150
7.5	Nucleic Acid Structure	151
7.6	Protein Structure	153
7.7	Enzyme Catalysis	155
	References	157
	Problems	157
8.	Electronic Spectra	159
8.1	Introduction	159
8.2	Absorption Spectra	160
8.3	Ultraviolet Spectra of Proteins	162
8.4	Nucleic Acid Spectra	164
8.5	Prosthetic Groups	165
8.6	Difference Spectroscopy	167
8.7	X-ray Absorption Spectroscopy	170
8.8	Fluorescence and Phosphorescence	171
8.9	RecBCD: Helicase Activity Monitored by Fluorescence	174
8.10	Fluorescence Energy Transfer: A Molecular Ruler	175
8.11	Application of Energy Transfer to Biological Systems	177
8.12	Dihydrofolate Reductase	180
	References	181
	Problems	182
9.	Circular Dichroism, Optical Rotary Dispersion, and Fluorescence Polarization	186
9.1	Introduction	186
9.2	Optical Rotary Dispersion	188
9.3	Circular Dichroism	189
9.4	Optical Rotary Dispersion and Circular Dichroism of Proteins	190
9.5	Optical Rotation and Circular Dichroism of Nucleic Acids	192
9.6	Small Molecule Binding to DNA	194
9.7	Protein Folding	196
9.8	Interaction of DNA with Zinc Finger Proteins	199
9.9	Fluorescence Polarization	201

9.10	Integration of HIV Genome into Host Genome	202
9.11	α -ketoglutarate Dehydrogenase	203
	References	206
	Problems	206
10.	Vibrations in Macromolecules	210
10.1	Introduction	210
10.2	Infrared Spectroscopy	212
10.3	Raman Spectroscopy	213
10.4	Structure Determination with Vibrational Spectroscopy	215
10.5	Resonance Raman Spectroscopy	218
10.6	Structure of Enzyme–Substrate Complexes	220
	References	221
	Problems	221
11.	Principles of Nuclear Magnetic Resonance and Electron Spin Resonance	223
11.1	Introduction	223
11.2	NMR Spectrometers	226
11.3	Chemical Shifts	227
11.4	Spin–Spin Splitting	229
11.5	Relaxation Times	232
11.6	Multidimensional NMR	234
11.7	Magnetic Resonance Imaging	240
11.8	Electron Spin Resonance	241
	References	244
	Problems	244
12.	Applications of Magnetic Resonance to Biology	248
12.1	Introduction	248
12.2	Regulation of DNA Transcription	248
12.3	Protein–DNA Interactions	251
12.4	Dynamics of Protein Folding	252
12.5	RNA Folding	254
12.6	Lactose Permease	257
12.7	Conclusion	260
	References	260
SPECIAL TOPICS		263
13.	Ligand Binding to Macromolecules	265
13.1	Introduction	265
13.2	Binding of Small Molecules to Multiple Identical Binding Sites	265
13.3	Macroscopic and Microscopic Equilibrium Constants	268

13.4	Statistical Effects in Ligand Binding to Macromolecules	269
13.5	Experimental Determination of Ligand Binding Isotherms	273
13.6	Binding of Cro Repressor Protein to DNA	276
13.7	Cooperativity in Ligand Binding	279
13.8	Models for Cooperativity	281
13.9	Kinetic Studies of Cooperative Binding	287
13.10	Allosterism	289
	References	292
	Problems	292
14.	Hydrodynamics of Macromolecules	295
14.1	Introduction	295
14.2	Frictional Coefficient	295
14.3	Diffusion	298
14.4	Centrifugation	301
14.5	Velocity Sedimentation	302
14.6	Equilibrium Centrifugation	305
14.7	Preparative Centrifugation	307
14.8	Density Centrifugation	307
14.9	Viscosity	309
14.10	Electrophoresis	310
14.11	Peptide-Induced Conformational Change of a Major Histocompatibility Complex Protein	312
14.12	Ultracentrifuge Analysis of Protein–DNA Interactions	315
	References	316
	Problems	316
15.	Mass Spectrometry	320
15.1	Introduction	320
15.2	Mass Analysis	320
15.3	Tandem Mass Spectrometry (MS/MS)	323
15.4	Ion Detectors	324
15.5	Ionization of the Sample	325
15.6	Sample Preparation/Analysis	327
15.7	Proteins and Peptides	329
15.8	Protein Folding	331
15.9	Other Biomolecules	334
	References	335
	Problems	335
	APPENDICES	337
	Appendix 1. Useful Constants and Conversion Factors	339
	Appendix 2. Structures of the Common Amino Acids at Neutral pH	340

Appendix 3. Common Nucleic Acid Components	342
Appendix 4. Standard Free Energies and Enthalpies of Formation at 298 K, 1 atm, pH 7, and 0.25 M Ionic Strength	343
Appendix 5. Standard Free Energy and Enthalpy Changes for Biochemical Reactions at 298 K, 1 atm, pH 7.0, pMg 3.0, and 0.25 M Ionic Strength	345
Index	347
