Preface

ix

1	Statistics and medical science	1
1.1	Introduction	1
1.2	On the nature of science	3
1.3	How the scientific method uses statistics	5
1.4	Finding an outcome variable to assess your hypothesis	7
1.5	How we draw medical conclusions from statistical results	8
1.6	A few words about probabilities	13
1.7	The need for honesty: the multiplicity issue	16
1.8	Prespecification and <i>p</i> -value history	19
1.9	Adaptive designs: controlling the risks in an experiment	21
1.10	The elusive concept of probability	23
1.11	Comments and further reading	26
	References	27
2	Observational studies and the need for clinical trials	29
2.1	Introduction	29
2.2	Investigations of medical interventions and risk factors	29
2.3	Observational studies and confounders	33
2.4	The experimental study	39
2.5	Population risks and individual risks	42
2.6	Confounders, Simpson's paradox and stratification	44
2.7	On incidence and prevalence in epidemiology	51
2.8	Comments and further reading	53
	References	54
3	Study design and the bias issue	57
3.1	Introduction	57
3.2	What bias is all about	58
3.3	The need for a representative sample: on selection bias	58
3.4	Group comparability and randomization	61
3.5	Information bias in a cohort study	65
3.6	The study, or placebo, effect	68
3.7	The curse of missing values	70
3.8	Approaches to data analysis: avoiding self-inflicted bias	75
3.9	On meta-analysis and publication bias	79
3.10	Comments and further reading	81
	References	82

4	The anatomy of a statistical test	85
4.1	Introduction	85
4.2	Statistical tests, medical diagnosis and Roman law	85
4.3	The risks with medical diagnosis	87
4.3.1	Medical diagnosis based on a single test	87
4.3.2	Bayes' theorem and the use and misuse of screening tests	89
4.4	The law: a non-quantitative analogue	91
4.5	Risks in statistical testing	93
4.5.1	Does tonsillectomy increase the risk of Hodgkin's lymphoma?	93
4.5.2	General discussion about statistical tests	98
4.6	Making statements about a binomial parameter	101
4.6.1	The frequentist approach	101
4.6.2	The Bayesian approach	104
4.7	The bell-shaped error distribution	109
4.8	Comments and further reading	112
	References	113
4.A	Appendix: The evolution of the central limit theorem	115
5	Learning about parameters, and some notes on planning	119
5.1	Introduction	119
5.2	Test statistics described by parameters	120
5.3	How we describe our knowledge about a parameter from an experiment	122
5.4	Statistical analysis of two proportions	127
5.4.1	Some ways to compare two proportions	127
5.4.2	Analysis of the group difference	130
5.5	Adjusting for confounders in the analysis	133
5.6	The power curve of an experiment	138
5.7	Some confusing aspects of power calculations	143
5.8	Comments and further reading	145
	References	145
5.A	Appendix: Some technical comments	146
5.A.1	The non-central hypergeometric distribution and 2×2 tables	146
5.A.2	The gamma and χ^2 distributions	147
6	Empirical distribution functions	149
6.1	Introduction	149
6.2	How to describe the distribution of a sample	149
6.3	Describing the sample: descriptive statistics	153
6.4	Population distribution parameters	156
6.5	Confidence in the CDF and its parameters	158
6.6	Analysis of paired data	162
6.7	Bootstrapping	163
6.8	Meta-analysis and heterogeneity	166
6.9	Comments and further reading	169
	References	170

6.A	Appendix: Some technical comments	171
6.A.1	The extended family of the univariate Gaussian distributions	171
6.A.2	The Wiener process and its bridge	173
6.A.3	Confidence regions for the CDF and the Kolmogorov–Smirnov test	174
7	Correlation and regression in bivariate distributions	177
7.1	Introduction	177
7.2	Bivariate distributions and correlation	178
7.3	On baseline corrections and other covariates	183
7.4	Bivariate Gaussian distributions	186
7.5	Regression to the mean	189
7.6	Statistical analysis of bivariate Gaussian data	195
7.7	Simultaneous analysis of two binomial proportions	199
7.8	Comments and further reading	203
	References	203
7.A	Appendix: Some technical comments	205
7.A.1	The regression to the mode equation	205
7.A.2	Analysis of data from the multivariate Gaussian distribution	206
7.A.3	On the geometric approach to univariate confidence limits	207
8	How to compare the outcome in two groups	209
8.1	Introduction	209
8.2	Simple models that compare two distributions	210
8.3	Comparison done the horizontal way	212
8.4	Analysis done the vertical way	216
8.5	Some ways to compute p -values	224
8.6	The discrete Wilcoxon test	226
8.7	The two-period crossover trial	229
8.8	Multivariate analysis and analysis of covariance	232
8.9	Comments and further reading	239
	References	240
8.A	Appendix: About U-statistics	241
9	Least squares, linear models and beyond	245
9.1	Introduction	245
9.2	The purpose of mathematical models	246
9.3	Different ways to do least squares	250
9.4	Logistic regression, with variations	252
9.5	The two-step modeling approach	257
9.6	The effect of missing covariates	260
9.7	The exponential family of distributions	263
9.8	Generalized linear models	269
9.9	Comments and further reading	270
	References	270

10	Analysis of dose response	273
10.1	Introduction	273
10.2	Dose-response relationship	274
10.3	Relative dose potency and therapeutic ratio	278
10.4	Subject-specific and population averaged dose response	279
10.5	Estimation of the population averaged dose-response relationship	281
10.6	Estimating subject-specific dose responses	285
10.7	Comments and further reading	288
	References	288
11	Hazards and censored data	289
11.1	Introduction	289
11.2	Censored observations: incomplete knowledge	290
11.3	Hazard models from a population perspective	291
11.4	The impact of competing risks	296
11.5	Heterogeneity in survival analysis	300
11.6	Recurrent events and frailty	304
11.7	The principles behind the analysis of censored data	306
11.8	The Kaplan-Meier estimator of the CDF	309
11.9	Comments and further reading	312
	References	313
11.A	Appendix: On the large-sample approximations of counting processes	314
12	From the log-rank test to the Cox proportional hazards model	317
12.1	Introduction	317
12.2	Comparing hazards between two groups	318
12.3	Nonparametric tests for hazards	319
12.4	Parameter estimation in hazard models	324
12.5	The accelerated failure time model	328
12.6	The Cox proportional hazards model	331
12.7	On omitted covariates and stratification in the log-rank test	336
12.8	Comments and further reading	338
	References	339
12.A	Appendix: Comments on interval-censored data	341
13	Remarks on some estimation methods	343
13.1	Introduction	343
13.2	Estimating equations and the robust variance estimate	344
13.3	From maximum likelihood theory to generalized estimating equations	351
13.4	The analysis of recurrent events	355
13.5	Defining and estimating mixed effects models	360
13.6	Comments and further reading	366
	References	367
13.A	Appendix: Formulas for first-order bias	368
