Preface	xi
1 Nucleic Acid Structure and Function	1
1.1 Structure of nucleic acids	1
1.1.1 DNA	1
1.1.2 RNA	2
1.1.3 Hydrophobic interactions	3
1.1.4 Different forms of the double helix	4
1.1.5 Supercoiling	5
1.1.6 Denaturation and hybridization	8
1.1.7 Orientation of nucleic acid strands	10
1.2 Replication of DNA	11
1.2.1 Unwinding and rewinding	12
1.2.2 Fidelity of replication; proofreading	12
1.3 Chromosome replication and cell division	14
1.4 DNA repair	16
1.4.1 Mismatch repair	16
1.4.2 Excision repair	18
1.4.3 Recombination (post-replication) repair	19
1.4.4 SOS repair	21
1.5 Gene expression	21
1.5.1 Transcription	21
1.5.2 Translation	25
1.5.3 Post-translational events	31
1.6 Gene organization	35
2 Mutation and Variation	37
2.1 Variation and evolution	37
2.1.1 Fluctuation test	39
2.1.2 Replica plating	41
2.1.3 Directed mutation in bacteria?	41
2.2 Types of mutation	43
2.2.1 Point mutations	43
2.2.2 Conditional mutants	44
2.2.3 Variation due to larger-scale DNA alterations	45
2.2.4 Extrachromosomal agents and horizontal gene transfer	46

2.3	Recombination	47
2.3.1	A model of the general (homologous) recombination process	48
2.3.2	Enzymes involved in recombination	49
2.4	Phenotypes	50
2.4.1	Restoration of phenotype	52
2.5	Mechanisms of mutation	55
2.5.1	Spontaneous mutation	55
2.5.2	Chemical mutagens	57
2.5.3	Ultraviolet irradiation	60
2.6	Isolation and identification of mutants	63
2.6.1	Mutation and selection	63
2.6.2	Replica plating	64
2.6.3	Isolation of other mutants	65
2.6.4	Molecular methods	66
3	Regulation of Gene Expression	71
3.1	Gene copy number	73
3.2	Transcriptional control	73
3.2.1	Promoters	73
3.2.2	Terminators, attenuators and anti-terminators	84
3.2.3	Induction and repression: regulatory proteins	84
3.2.4	Two-component regulatory systems	93
3.2.5	Global regulatory systems	97
3.2.6	Quorum sensing	98
3.3	Translational control	102
3.3.1	Ribosome binding	102
3.3.2	Codon usage	104
3.3.3	Stringent response	104
3.3.4	Regulatory RNA	105
3.4	Phase variation	114
4	Genetics of Bacteriophages	115
4.1	Bacteriophage structure	116
4.2	Single-strand DNA bacteriophages	118
4.2.1	ϕ X174	118
4.2.2	M13	121
4.3	RNA-containing phages: MS2	121
4.4	Double-stranded DNA phages	121
4.4.1	Bacteriophage T4	122
4.4.2	Bacteriophage λ	124
4.4.3	Lytic and lysogenic regulation of bacteriophage λ	128
4.5	Restriction and modification	136
4.6	Bacterial resistance to phage attack	138
4.7	Complementation and recombination	138
4.8	Why are bacteriophages important?	140

4.8.1	Phage typing	141
4.8.2	Phage therapy	141
4.8.3	Phage display	142
4.8.4	Phages in the natural environment	142
4.8.5	Bacterial virulence and phage conversion	144
5	Plasmids	147
5.1	Some bacterial characteristics are determined by plasmids	148
5.1.1	Antibiotic resistance	148
5.1.2	Colicins and bacteriocins	148
5.1.3	Virulence determinants	149
5.1.4	Plasmids in plant-associated bacteria	149
5.1.5	Metabolic activities	150
5.2	Molecular properties of plasmids	152
5.2.1	Plasmid replication and control	154
5.2.2	Partitioning	164
5.2.3	Host range	164
5.2.4	Plasmid incompatibility	167
5.3	Plasmid stability	168
5.3.1	Plasmid integrity	168
5.3.2	Partitioning	169
5.3.3	Differential growth rate	174
5.4	Associating a plasmid with a phenotype	174
6	Gene Transfer	177
6.1	Transformation	178
6.2	Conjugation	180
6.2.1	Mechanism of conjugation	180
6.2.2	The F plasmid	185
6.2.3	Conjugation in other bacteria	186
6.3	Transduction	190
6.3.1	Specialized transduction	192
6.4	Recombination	192
6.4.1	Consequences of recombination	193
6.4.2	Site-specific and non-homologous (illegitimate) recombination	194
6.5	Mosaic genes and chromosome plasticity	195
7	Genomic Plasticity: Movable Genes and Phase Variation	199
7.1	Insertion sequences	199
7.1.1	Structure of insertion sequences	199
7.1.2	Occurrence of insertion sequences	200
7.2	Transposons	202
7.2.1	Structure of transposons	204
7.2.2	Integrations	206
7.2.3	ISCR elements	208

7.3	Mechanisms of transposition	209
7.3.1	Replicative transposition	209
7.3.2	Non-replicative (conservative) transposition	212
7.3.3	Regulation of transposition	213
7.3.4	Activation of genes by transposable elements	214
7.3.5	Mu: A transposable bacteriophage	214
7.3.6	Conjugative transposons	215
7.4	Phase variation	215
7.4.1	Variation mediated by simple DNA inversion	217
7.4.2	Variation mediated by nested DNA inversion	218
7.4.3	Antigenic variation in the gonococcus	218
7.4.4	Phase variation by slipped-strand mispairing	222
7.4.5	Phase variation mediated by differential DNA methylation	223
7.5	Clustered regularly interspersed short palindromic repeats	224
8	Genetic Modification: Exploiting the Potential of Bacteria	227
8.1	Strain development	228
8.1.1	Generation of variation	228
8.1.2	Selection of desired variants	228
8.2	Overproduction of primary metabolites	229
8.2.1	Simple pathways	229
8.2.2	Branched pathways	230
8.3	Overproduction of secondary metabolites	232
8.4	Gene cloning	233
8.4.1	Cutting and joining DNA	234
8.4.2	Plasmid vectors	234
8.4.3	Bacteriophage λ vectors	238
8.4.4	Cloning larger fragments	240
8.4.5	Bacteriophage M13 vectors	242
8.5	Gene libraries	242
8.5.1	Construction of genomic libraries	242
8.5.2	Screening a gene library	244
8.5.3	Cloning PCR products	246
8.5.4	Construction of a cDNA library	247
8.6	Products from cloned genes	248
8.6.1	Expression vectors	248
8.6.2	Making new genes	250
8.6.3	Other bacterial hosts	253
8.6.4	Novel vaccines	255
8.7	Other uses of gene technology	256
9	Genetic Methods for Investigating Bacteria	257
9.1	Metabolic pathways	257
9.1.1	Complementation	257
9.1.2	Cross-feeding	258

9.2	Microbial physiology	259
9.2.1	Reporter genes	261
9.2.2	Chromatin immunoprecipitation	262
9.2.3	Cell division	264
9.2.4	Motility and chemotaxis	266
9.2.5	Cell differentiation	267
9.3	Bacterial virulence	271
9.3.1	Wide-range mechanisms of bacterial pathogenesis	271
9.3.2	Detection of virulence genes	272
9.4	Specific mutagenesis	280
9.4.1	Gene replacement	280
9.4.2	Antisense RNA	282
9.5	Taxonomy, evolution and epidemiology	282
9.5.1	Molecular taxonomy	282
9.5.2	GC content	283
9.5.3	16 S rRNA	283
9.5.4	Denaturing-gradient gel electrophoresis and temperature-gradient gel electrophoresis	286
9.5.5	Diagnostic use of PCR	286
9.5.6	Molecular epidemiology	287
10	Gene Mapping to Genomics and Beyond	295
10.1	Gene mapping	295
10.1.1	Conjugational analysis	295
10.1.2	Gene libraries	298
10.1.3	Restriction mapping and pulsed-field gel electrophoresis	298
10.2	DNA sequence determination	301
10.2.1	Sanger sequencing	301
10.2.2	Dye terminator sequencing	304
10.2.3	Pyrosequencing	304
10.2.4	Massively parallel sequencing	305
10.3	Genome sequencing	307
10.3.1	Genome-sequencing strategies	308
10.3.2	Relating sequence to function	309
10.3.3	Metagenomics	314
10.4	Comparative genomics	315
10.4.1	Microarrays	318
10.5	Analysis of gene expression	320
10.5.1	Transcriptional analysis	320
10.5.2	Translational analysis	325
10.6	Metabolomics	329
10.7	Systems biology and synthetic genomics	329
10.7.1	Systems biology	329
10.7.2	Synthetic genomics	329
10.8	Conclusion	330

Appendix A	Further Reading	333
Appendix B	Abbreviations Used	337
Appendix C	Glossary	341
Appendix D	Enzymes and other Proteins	365
Appendix E	Genes	369
Appendix F	Standard Genetic Code	373
Appendix G	Bacterial Species	375

Index	379
