Contributors	ix
Foreword	xi
David Botstein	
Introduction	xiii
Nina V. Fedoroff	
Chapter 1 The Discovery of Transposition	3
Nina V. Fedoroff	
Introduction	3
Studies on Variegation	3
Mutable Genes	5
McClintock's Studies on Chromosome Breakage	6
Recognition that <i>Ds</i> Transposes	8
Explaining Mutable Genes	9
Molecular Endnote	12
References	12
Chapter 2 A Field Guide to Transposable Elements	15
Alan H. Schulman and Thomas Wicker	
The C-value Paradox	15
The Quantity of Transposable Elements Determines Genome Size	16
General Classification Scheme for Transposable Elements	17
Class II Elements	19
Class I: The Non-LTR and LTR Retrotransposons	20
Evolutionary Origins of Transposable Elements	25
Non-autonomous Transposable Elements	28
Transposable Element Demography and Genome Ecology	30
Conclusions: Rehabilitation of Transposable Elements	32
Acknowledgments	34
References	34

Chapter 3	The Mechanism of <i>Ac/Ds</i> Transposition	41
	Thomas Peterson and Jianbo Zhang	
	Transposition of <i>Ac/Ds</i> Elements	41
	The Enigmatic <i>Ac</i> Dosage Effect	42
	<i>cis</i> and <i>trans</i> Effects on <i>Ac/Ds</i> Transposition	43
	Molecular Characterization of Transposable Elements	44
	The Excision and Insertion Reactions	45
	Formation of <i>Ds</i> from <i>Ac</i>	48
	Standard versus Alternative Transposition	48
	Sister Chromatid Transposition	48
	Reversed-ends Transposition	51
	How Does <i>Ds</i> Break Chromosomes?	53
	Alternative Transposition, DNA Methylation, and the Sequence of Transposition	
	Reactions	54
	Potential Applications of Alternative Transposition	55
	Perspective	56
	References	56
Chapter 4	McClintock and Epigenetics	61
	Nina V. Fedoroff	
	Introduction	61
	<i>Spm-suppressible</i> Alleles	61
	<i>Spm-dependent</i> Alleles	64
	Cryptic <i>Spm</i>	66
	Presetting	66
	Molecular Machinery of Epigenetic Regulation	67
	Summary	68
	References	69
Chapter 5	Molecular Mechanisms of Transposon Epigenetic Regulation	71
	Robert A. Martienssen and Vicki L. Chandler	
	Introduction	71
	Chromatin Remodeling, DNA and Histone Modification	73
	RNA Interference (RNAi) and RNA-Directed DNA Methylation (RdDM)	75
	Heterochromatin Reprogramming and Germ Cell Fate	79
	Transgenerational Inheritance of Transposon Silencing	82
	Paramutation	83
	Conclusions	85
	References	85
Chapter 6	Transposons in Plant Gene Regulation	93
	Damon R. Lisch	
	Introduction	93
	New Regulatory Functions	94
	TE-Induced Down-Regulation	97

Deletions and Rearrangements	98
Suppressible Alleles	100
TEs and Plant Domestication	103
The Dynamic Genome	108
References	110
Chapter 7 Imprinted Gene Expression and the Contribution of Transposable Elements	117
Mary A. Gehring	
Why are Genes Imprinted?	118
The Developmental Origin of Endosperm	118
Selection for Imprinted Expression	121
Principles Derived from the First Imprinted Gene	122
Gene Imprinting and Parent-of-Origin Effects on Seed Development	124
What Genes are Imprinted?	124
Epigenome Dynamics during Seed Development	127
Epigenetic Landscape in Vegetative Tissues	127
Cytological Observations of Chromatin in Seeds	129
Epigenomic Profiling in Seeds	130
Mechanisms of Gene Imprinting and the Relation to TEs	132
TEs and Allele-Specific Imprinting	136
Insights from Whole Genome Studies	137
Outstanding Questions	138
References	138
Chapter 8 Transposons and Gene Creation	143
Hugo K. Dooner and Clifford F. Weil	
Introduction	143
Capture of Gene Fragments by TEs and Formation of Chimeric Genes	144
Co-Option of a TE Gene by the Host	148
Fusion of TE and Host Genes	150
Alterations of Host Gene Sequences by TE Excisions	151
Alterations of Host Coding Sequences by TE Insertions	152
Acquisition by Host Genes of New Regulatory Sequences from TEs	153
Interaction of TEs with Target Gene mRNA Splicing and Structure	155
Reshuffling of Host Sequences by Alternative Transpositions	156
Conclusion	158
References	158
Chapter 9 Transposons in Plant Speciation	165
Avraham A. Levy	
Introduction	165
Genetic Models of Speciation	165
Speciation – a Gradual or a Rapid Process?	166
Speciation Through Accumulation of Mutations	166
DNA Cut-and-Paste TEs and Speciation	167

Copy-and-Paste TEs and Speciation	168
TE-Mediated Speciation – a Likely Scenario?	169
Plant Speciation Through Hybridization and Allopolyploidization	169
Induction of Transposition upon Hybridization and Polyploidization	170
Epigenetic Alteration of TEs upon Hybridization and Polyploidization	170
Transcriptional Activation of TEs upon Hybridization and Polyploidization	171
Alterations in Small RNAs upon Hybridization and Polyploidization	171
A Mechanistic Model for Responses to Genome Shock	172
Dysregulation of Gene Expression by Novel Interactions Between Regulatory Factors	173
Altered Protein Complexes	174
Why TEs Become Activated when Cellular Processes are Dysregulated	174
Conclusions	175
Acknowledgments	176
References	176
Chapter 10 Transposons, Genomic Shock, and Genome Evolution	181
Nina V. Fedoroff and Jeffrey L. Bennetzen	
How Transposons Came to be Called “Selfish” DNA	181
The “Selfish DNA” Label Stuck to Transposons	182
Transposons Coevolved with Eukarotic Genomes	182
Sequence Duplication: The Real Innovation	183
The Facilitator: Epigenetic Control of Homologous Recombination	183
Epigenetic Mechanisms, Duplication and Genome Evolution	185
Plant Genome Organization: Gene Islands in a Sea of Repetitive DNA	186
Transposon Neighborhoods and Insertion Site Selection	187
Genome Evolution: Colinearity and Its Erosion	189
Genome Contraction and Divergence of Intergenic Sequences	191
Transposases Sculpt Genomes	192
Small Regulatory RNAs from Transposons	193
Genome Shocks	194
Genome Evolvability	195
References	196
Index	203

Color plate is located between pages 142 and 143.
