	<i>Preface</i>	<i>page xi</i>
1	Introduction	1
	The problem of pattern specification	1
	Major concepts of biological patterning	2
	The purpose of the book	6
2	Interactions of developing organs	11
	Generalizations concerning relations between organs	12
	Quantitative expressions of correlative signals	18
	Primordia are limited by the diversion of correlative signals	21
3	Hormones as correlative agents	25
	A general signal of developing shoot tissues	26
	Hormonal signals of roots	29
	Hypothesis concerning the hormonal correlations between plant organs	31
	Roles for additional developmental signals	34
4	Callus and tumor development	38
	Differentiation and partial organization of callus and tumor tissues	38
	Callus as a response to disrupted correlative relations	42
	Auxin and cytokinin requirements of cultured callus	44
	A hormonal basis of tumor development	46
	Correlative effects of callus tissues	47
	Conclusions concerning callus development	50
5	The polarization of tissues	52
	A. <i>The varied expressions of polarity</i>	52
	Types of polar development	53
	The basis of polar regeneration	56
	B. <i>The induction and stability of tissue polarity</i>	58
	Induction of vascular differentiation by the flow of auxin	59
	Evidence of polarity changes	63

	A common basis for polarity reorientation and polarity determination	65
	The cellular basis of tissue polarity	67
6	The canalization of vascular differentiation	70
	The canalization of signal flow	71
	Vascular networks and the concept of axial canalization	77
	The complexity of the vascular system	81
	Conclusions concerning vascular patterning	87
7	Cell lineages	88
	The developmental significance of cell lineages	88
	Methods of following cell lineages	90
	The predictability of cell lineages	94
	The concept of initial cells	95
	Conclusion concerning the role of cell lineages	100
8	Stomata as an example of meristemoid development	101
	The concept of meristemoids	101
	Relations between the cells of a functional stoma	103
	Spacing patterns of stomata and their measurement	107
	Controls of stomata spacing	110
	Roles of cell competence in stomata patterning	113
	Conclusions and the problem of stomata density	115
9	Expressions of cellular interactions	118
	Cytoplasmic strands and wall thickenings	118
	Contacts through cell walls	121
	Grafts as evidence of cellular interactions	124
	Conclusions	128
10	Apical meristems	130
	Promeristems and primary meristems in shoot apices	131
	The organization of root apices	135
	Possible controls of promeristem organization	137
	The determinate nature of primary meristems	142
	The differentiation of apical meristems	143
11	The localization of new leaves	148
	The location of new leaves is determined within the apex	150
	The longitudinal localization of leaf initiation	153
	The circumferential localization of new leaves	154
	Conclusion: leaf initiation and phyllotaxis	156
	The organization of multicellular primordia	159

12 A temporal control of apical differentiation	162
Leaf number as a criterion for maturation	163
Experimental modifications of size	167
The possible role of the integrated distance to the roots	170
Other expressions of maturation	174
13 Generalizations about tissue patterning	179
Controls of cellular differentiation	179
Patterning principles	185
Towards a general theory of biological patterning	189
