

Contents

Introduction	1
Definition and scope	1
Cellular material for immobilization	4
Immobilization methods	8
Characteristics and advantages of immobilized cells	12
1 Cell biology of immobilized cells	19
Prokaryotes	25
Yeasts	29
Fungi	32
Higher plants	35
Mammalian cells	40
Cell viability and cell death	43
2 Production and characterization of cells for use in immobilized cell reactors	48
Selection of cells	48
Conventional fermentation processes	50
Biocatalytic activity	54
Growth of cells for immobilization	63
Techniques for studying immobilized cells	65
Physical characteristics of immobilized cell preparations	73
3 Entrapment, encapsulation and retention by membranes	77
Entrapment	77
Immiscible liquid systems	109
Microencapsulation	113
Immobilization by permeable membranes	115
4 Covalent bonding, cross-linking and flocculation of cells	123
Glutaraldehyde coupling	125
Carbodiimide coupling	127
Metal hydroxide coupling	127
Flocculation	128

5 Adsorption	135
Inorganic supports	148
Organic supports	154
Ion-exchange supports	162
6 Special methods	166
Permeabilization	167
Protoplasts	173
Organelles	175
Co-immobilization	177
Animal cells	181
7 Reactor design and operation	184
Types of reactor	191
8 Special systems	217
Immobilized cell electrodes	218
Detoxification units	223
Cell affinity immobilization	224
References	229
Index	249

Authors' note

In quoted work, the original authors' scientific names for organisms have been retained.
