Preface

xii

1 A Brief Introduction to <i>Dictyostelium discoideum</i> and its Relatives	1
2 A History of Research on <i>Dictyostelium discoideum</i>	9
2.1 The classical experiments of Kenneth Raper	12
2.2 Chemotaxis and aggregation	16
2.3 Biochemistry and molecular biology	18
3 The Evolutionary Biology of <i>Dictyostelium</i>	20
3.1 A digression into ecology	20
3.2 Soil amoebae have predators	21
3.3 The amoebae can respond to starvation in three ways	22
3.3.1 The microcyst	25
3.3.2 The macrocyst	25
3.3.3 Fruiting bodies	27
3.4 The forms of development evolved in a sequence	27
3.5 Genetic heterogeneity in wild populations	28
3.6 The evolution of cooperativity	29
3.7 The cells in a <i>Dictyostelium</i> aggregate compete to form spores	30
3.8 Size limitations in an aggregative organism	33
3.9 The extraordinary parasitism of <i>D. caveatum</i>	33
3.10 Molecular phylogeny	35

4 The Genome and Genetics	40
4.1 The genome is relatively small and will be sequenced soon	40
4.2 The ribosomal genes are coded in an extra-chromosomal palindrome	43
4.3 <i>Dictyostelium</i> species contain several families of replicating plasmids	44
4.4 The genome is littered with transposable elements	45
4.4.1 Tdd-2 and Tdd-3	46
4.4.2 DIRS-1	46
4.4.3 DRE	47
4.4.4 Skipper	47
4.5 The mitochondrial genome	48
4.6 Maintaining the genome – the DNA repair mechanisms of <i>Dictyostelium</i>	49
4.7 Molecular genetics	50
4.8 Mutagenesis	51
4.9 Restriction enzyme-mediated integration	53
4.10 Parasexual and sexual genetic manipulations	55
4.10.1 Parasexual genetics	55
4.10.2 Sexual recombination	57
5 Membranes and Organelles of <i>Dictyostelium</i>	59
5.1 The plasma membrane	59
5.2 Channels and pumps of the plasma membrane	61
5.3 Membrane systems that transiently connect to the plasma membrane	61
5.4 Axenic cells feed by macropinocytosis	64
5.5 Phagocytosis	66
5.6 Lysosomes	67
5.7 Endoplasmic reticulum, Golgi, and nuclei	68
5.8 Mitochondria and peroxisomes	69
5.9 The autophagic vacuole	69
6 Cell Motility and the Cytoskeleton	70
6.1 Actin and its binding proteins	71
6.1.1 G-actin-binding proteins	72
6.1.2 F-actin-binding proteins	72
6.1.3 Cross-linking proteins	74
6.1.4 Attaching to the membrane	75
6.2 Myosin motors – conventional myosin	76
6.3 Myosin motors – the unconventional myosins	78
6.4 Building and retracting the pseudopod	79
6.5 Strengthening the filaments of actin	82
6.6 Moving the cell	82
6.7 Signaling to the cytoskeleton	84
6.8 Cytokinesis	85

6.9	The microtubule cytoskeleton	86
7	The Transition from Growth to Development: From Starvation to Self-Sustaining cAMP Signal Relay	89
7.1	Cells can detect imminent starvation	89
7.2	Growth-specific events cease during development	92
7.3	The first events after starvation	93
7.4	YakA kinase regulates the growth to development transition	95
8	Chemotaxis and Aggregation	98
8.1	An overview	98
8.2	There are several ways to study the cellular response to cAMP binding	99
8.3	Second messengers and cytoskeletal events can be studied with suspended cells	100
8.4	Components of the cAMP signal transduction and relay pathway	103
8.4.1	The cAR1 receptor is essential to aggregation	105
8.4.2	The cAR1 protein has several important domains	108
8.4.3	cAR1 initiates G protein-dependent signal transduction pathways	111
8.4.4	The $\beta\gamma$ subunit stimulates adenylyl cyclase (ACA) in conjunction with other proteins	112
8.4.5	The signal transduction components beyond ACA	114
8.4.6	RegA is an unusual phosphodiesterase (PDE) and affects the activity of cAMP-dependent protein kinase (PKA)	115
8.4.7	The PKA is essential for gene induction and regulates events in the cytoplasm	115
8.5	The developmental regulation of chemotactic components	116
8.6	cGMP and calcium mobilize the cytoskeleton	116
8.7	cGMP controls motility during chemotaxis	118
8.8	The amoebae control extracellular cAMP by secreting a PDE and a PDE inhibitor (PDI)	121
8.9	The cells can sense density and aggregate size	125
8.10	Auto-induction of the chemotactic response	127
8.11	Mobilizing the chemotactic machinery	128
8.12	Polarity of movement and the polarity of G-protein activation	131
8.13	Mathematical simulations to explain signaling in <i>Dictyostelium</i>	135
9	Differentiation and Adhesion in the Aggregate	139
9.1	Amoebae form a sheath during aggregation	140
9.2	The transition from aggregation to loose mound is mediated by a transcription factor named GBF	141

9.3	The discovery of cell type-specific genes provided important tools to study pattern formation	143
9.4	Pattern formation begins in the mound	144
9.5	The position of PstA, PstO, and PstAB cells	146
9.6	Differentiation inducing factor (DIF) and the origin of prestalk cells	147
9.7	Are any prestalk genes expressed without DIF?	151
9.8	The history of a cell affects its fate	152
9.9	How are the constant ratios of prestalk and prespore cells to be explained?	154
9.10	What is the basis of cell sorting?	156
9.11	Overexpression of PKA can compensate for a lack of cAMP	158
9.12	The cells induce several adhesion systems during formation of the mound	158
9.12.1	Gp24	159
9.12.2	Gp80	159
9.12.3	Gp64	162
9.13	Substrate adhesion	162
9.14	The genetic complexity of mound formation	163
10	The Behavior of Cells in the Slug	166
10.1	The tight aggregate elongates under control of the tip	166
10.2	Tips inhibit the formation of other tips	167
10.3	Slugs move toward light and heat	171
10.4	The unanticipated complexity of cells in the slug	173
10.4.1	The prestalk region in the slug can be subdivided	174
10.4.2	Cellular traffic and cell-type conversion during slug migration	177
10.4.3	How do prespore segments restore their severed prestalk tips?	177
10.5	How do the cells in the slug move?	178
10.6	Gene regulation within the prestalk and prespore zones	180
10.6.1	The <i>ecmA</i> and <i>ecmB</i> promoters are highly regulated	181
10.6.2	Dd-STATA binds to the <i>ecmB</i> promoter inhibitory sequences	182
10.6.3	Regulation of <i>ecmA</i>	183
10.6.4	The prespore gene promoters	184
10.7	Sluggish mutants maintain their repression of culmination	185
10.8	The stability of the differentiated slug cells	186
11	Culmination	188
11.1	Deciding when migration has gone on long enough	188
11.2	Early steps in culmination	189
11.3	Movements at the Mexican hat stage	192
11.4	The anatomic details of a culminant	193
11.5	Cellulose synthesis and the formation of stalk	197

11.6	Death comes to the stalk cells	198
11.7	Participation of the prespore cells in culmination	199
11.8	The final step in spore formation is regulated exocytosis	199
11.9	The coordination of spore and stalk formation	201
11.10	Small peptides and the timing of encapsulation	204
11.11	Genetic experiments suggest the source of the inducer of spore encapsulation	205
11.12	Ligands for two-component sensors	206
11.13	The targets of PKA	208
11.14	Culmination-defective mutants	208
12	Formation and Germination of Spores	210
12.1	The spore coat has a complex architecture	210
12.2	The proteins of the spore coat	211
12.3	The synthesis of cellulose in spores	215
12.4	The formation of the spore entails changes in the cytoplasm	216
12.5	Sporocarps contain inhibitors of germination	216
12.6	Amoebae emerge with caution	218
12.7	The program of spore germination	219
13	Resources	223
13.1	Books	223
13.2	Articles for the non-scientist	224
13.3	Films and videos	225
13.4	The Franke bibliographic database	225
13.5	Websites	225
	<i>References</i>	227
	<i>Index</i>	285
