|------------------------------------------------------------------|------|-------|
| List of contributors                                             | Page | ix    |
| Preface                                                          |      | xiii  |
| In memory of Charles Richard Taylor (1939–1995)                  |      |       |
| <i>Ewald R. Weibel and Liana Bolis</i>                           |      | xv    |
| A life with animals: from cat to fish <i>Liana Bolis</i>         |      | xviii |
| <br><b>1 Symmorphosis and optimization of biological design:</b> |      |       |
| <b>introduction and questions</b> <i>Ewald R. Weibel</i>         |      | 1     |
| <br><b>2 How much structure is enough?</b>                       |      | 11    |
| 2.1 Overview <i>Knut Schmidt-Nielsen</i>                         |      | 11    |
| 2.2 Convergence as an analytical tool in evaluating design       |      |       |
| <i>Steven Vogel</i>                                              |      | 13    |
| 2.3 Evolution of biological safety factors: a cost/benefit       |      |       |
| analysis <i>Jared M. Diamond</i>                                 |      | 21    |
| 2.4 Symmorphosis and safety factors                              |      |       |
| <i>R. McNeill Alexander</i>                                      |      | 28    |
| <br><b>3 Evolution of optimal systems</b>                        |      | 37    |
| 3.1 Overview <i>Malcolm S. Gordon</i>                            |      | 37    |
| 3.2 Conceptual and methodological issues in testing the          |      |       |
| predictions of symmorphosis <i>Theodore Garland, Jr.</i>         |      | 40    |
| 3.3 Testing the evolutionary origin and maintenance of           |      |       |
| symmorphosis <i>Martin E. Feder</i>                              |      | 48    |
| 3.4 The concept of symmorphosis applied to growing               |      |       |
| birds <i>Robert E. Ricklefs</i>                                  |      | 56    |

|          |                                                                                                                         |     |
|----------|-------------------------------------------------------------------------------------------------------------------------|-----|
| <b>4</b> | <b>Bone design and biomechanics</b>                                                                                     | 63  |
| 4.1      | Overview <i>Simon Maddrell</i>                                                                                          | 63  |
| 4.2      | Optimality in the design of bony elements<br><i>Pieter Dullemeijer</i>                                                  | 64  |
| 4.3      | Optimization of musculoskeletal design – does<br>symmorphosis apply? <i>Andrew A. Biewener</i>                          | 70  |
| 4.4      | Responses of bone to stress: constraints on<br>symmorphosis <i>Daniel E. Lieberman and</i><br><i>Alfred W. Crompton</i> | 78  |
| <b>5</b> | <b>Muscles and locomotion</b>                                                                                           | 87  |
| 5.1      | Overview <i>James W. Glasheen</i>                                                                                       | 87  |
| 5.2      | The malleability of skeletal muscle<br><i>Dirk Pette and Robert S. Staron</i>                                           | 89  |
| 5.3      | Fine tuning the molecular motor of muscle<br><i>H. Lee Sweeney</i>                                                      | 95  |
| 5.4      | Matching muscle performance to changing demand<br><i>Lawrence C. Rome</i>                                               | 103 |
| 5.5      | Moving on land: optimizing for minimum cost<br><i>Thomas J. Roberts</i>                                                 | 114 |
| 5.6      | Optimization of cost of transport in swimming<br><i>Daniel Weihs</i>                                                    | 121 |
| <b>6</b> | <b>Design of cells for metabolism</b>                                                                                   | 129 |
| 6.1      | Overview <i>Stan L. Lindstedt</i>                                                                                       | 129 |
| 6.2      | Molecular symmorphosis, metabolic regulation,<br>and metabolons <i>Paul A. Srere</i>                                    | 131 |
| 6.3      | Are protein isoforms requisite for optimizing regulation<br>of ATP turnover rates? <i>Peter W. Hochachka</i>            | 140 |
| 6.4      | Muscle energy balance in sound production and flight<br><i>Kevin E. Conley and Stan L. Lindstedt</i>                    | 147 |
| 6.5      | Design of glycolytic and oxidative capacities in muscles<br><i>Raul K. Suarez</i>                                       | 155 |
| <b>7</b> | <b>Lungs and gills for gas exchange</b>                                                                                 | 165 |
| 7.1      | Overview <i>Pierre Dejours</i>                                                                                          | 165 |
| 7.2      | Limits of adaptation in pulmonary gas exchange<br><i>Connie C. W. Hsia</i>                                              | 168 |

|           |                                                                                                                                                  |     |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7.3       | The lungs of the flying vertebrates – birds and bats:<br>is their structure optimized for this elite mode of<br>locomotion? <i>John N. Maina</i> | 177 |
| 7.4       | Gills of water-breathers: structures with multiple functions<br><i>Edwin W. Taylor</i>                                                           | 186 |
| 7.5       | Factors influencing the optimization of hemoglobin<br>oxygen transport in fish <i>David Randall</i>                                              | 195 |
| <b>8</b>  | <b>Nutrient supply system</b>                                                                                                                    | 203 |
| 8.1       | Overview <i>Amiram Shkolnik</i>                                                                                                                  | 203 |
| 8.2       | The match between load and capacity during lactation:<br>where is the limit to energy expenditure?<br><i>Kimberly A. Hammond</i>                 | 205 |
| 8.3       | Optimization in design of the digestive system<br><i>Ian D. Hume</i>                                                                             | 212 |
| 8.4       | How ruminants adapt and optimize their digestive<br>system “blueprint” in response to resource shifts<br><i>Reinhold R. Hofmann</i>              | 220 |
| 8.5       | Optimality in complex dynamic systems: constraints,<br>trade-offs, priorities <i>Wolfgang Wieser</i>                                             | 230 |
| <b>9</b>  | <b>Integrative systems for oxygen and fuel delivery</b>                                                                                          | 239 |
| 9.1       | Overview <i>Ricardo Martinez-Ruiz</i>                                                                                                            | 239 |
| 9.2       | Symmorphosis and the mammalian respiratory system:<br>what is optimal design and does it exist?<br><i>James H. Jones</i>                         | 241 |
| 9.3       | Adjusting maximal fuel delivery for differences in<br>demand <i>Jean-Michel Weber</i>                                                            | 249 |
| 9.4       | The converging pathways for oxygen and substrates<br>in muscle mitochondria <i>Hans Hoppeler</i>                                                 | 255 |
| 9.5       | Fuel specialists for endurance <i>Yvon Le Maho and<br/>Mohamed Bnouham</i>                                                                       | 263 |
| <b>10</b> | <b>Design of nervous systems</b>                                                                                                                 | 269 |
| 10.1      | Overview <i>Richard D. Keynes</i>                                                                                                                | 269 |
| 10.2      | The design of peripheral nerve fibers<br><i>Richard D. Keynes</i>                                                                                | 271 |
| 10.3      | Observing design with compound eyes<br><i>Simon B. Laughlin</i>                                                                                  | 278 |

|      |                                                                                                                              |     |
