

Contents

Chapter 1: A Perspective on Human Genetics

- 1.1 Genetics Is the Key to Biology 1
 - Genetics in Society: Genetic Disorders in Culture and Art* 2
- 1.2 What Are Genes and How Do They Work? 3
- 1.3 How Are Genes Transmitted from Parents to Offspring? 4
- 1.4 How Do Scientists Study Genes? 5
 - There are different approaches to the study of genetics. 5
 - Genetics is used in basic and applied research. 6
- 1.5 Has Genetics Affected Social Policy and Law? 7
 - Genetics has directly affected social policy. 7
 - Eugenics helped change immigration laws. 8
 - Eugenics helped restrict reproductive rights. 9
 - Spotlight on ... Eugenic Sterilization 10
 - Eugenics became associated with the Nazi movement. 10
 - Genetics in Society: Genetics, Eugenics, and Nazi Germany* 10
- 1.6 What Impact Is Genetics Having Now? 11
 - The Human Genome Project has been completed. 11
 - Health care uses genetic testing and genome scanning. 12
 - Biotechnology is impacting everyday life. 13
- 1.7 What Choices Do We Make in the Era of Genomics and Biotechnology? 14

Chapter 2: Cells and Cell Division 18

- 2.1 Cell Structure Reflects Function 20
 - Spotlight on ... A Fatal Membrane Flaw 20
 - There are two cellular domains: the plasma membrane and the cytoplasm. 20
 - Organelles are specialized structures in the cytoplasm. 21
- 2.2 The Cell Cycle Describes the Life History of a Cell 24
 - Interphase has three stages. 24
 - Cell division by mitosis occurs in four stages. 26
- 2.3 Mitosis Is Essential for Growth and Cell Replacement 29
- 2.4 Cell Division by Meiosis: The Basis of Sex 30
 - Meiosis I reduces the chromosome number. 31
 - Spotlight on ... Cell Division and Spinal Cord Injuries 32
 - Meiosis II begins with haploid cells. 32
 - Genetic Journeys: Sea Urchins, Cyclins, and Cancer* 33
 - Meiosis produces new combinations of genes in two ways. 34

Chapter 3: Transmission of Genes from Generation to Generation 42

- 3.1 Heredity: How Are Traits Inherited? 43
 - Spotlight on ... Mendel and Test Anxiety 44
- 3.2 Mendel's Experimental Design Resolved Many Unanswered Questions 44
- 3.3 Crossing Pea Plants: Mendel's Study of Single Traits 46
 - What were the results and conclusions from Mendel's first series of crosses? 46
 - The principle of segregation describes how a single trait is inherited. 47
 - Genetic Journeys: Ockham's Razor* 48
- 3.4 More Crosses with Pea Plants: The Principle of Independent Assortment 49
 - Mendel performed crosses involving two traits. 49
 - Analyzing the results and drawing conclusions 49
 - The principle of independent assortment explains the inheritance of two traits. 50
- 3.5 Meiosis Explains Mendel's Results: Genes Are on Chromosomes 52
- 3.6 Many Genes Have More Than Two Alleles 52
- 3.7 Variations on a Theme by Mendel 54
 - Codominant alleles are fully expressed in heterozygotes. 54
 - Incomplete dominance has a distinctive phenotype in heterozygotes. 54
- 3.8 Mendelian Inheritance in Humans 55
 - Segregation and independent assortment occur with human traits. 55
 - Pedigree construction is important to human genetics. 57

Chapter 4: Pedigree Analysis in Human Genetics 66

- 4.1 Studying the Inheritance of Traits in Humans 67
- 4.2 Pedigree Analysis Is a Basic Method in Human Genetics 68
- 4.3 There Is a Catalog of Human Genetic Traits 70
- 4.4 Analysis of Autosomal Recessive Traits 70
 - Cystic fibrosis is a recessive trait. 72
 - Genetic Journeys: Was Noah an Albino?* 73
 - Sickle cell anemia is a recessive trait. 74
- 4.5 Analysis of Autosomal Dominant Traits 76
 - Marfan syndrome is an autosomal dominant trait. 76
- 4.6 Sex-Linked Inheritance Involves Genes on the X and Y Chromosomes 78
- 4.7 Analysis of X-Linked Dominant Traits 79
- 4.8 Analysis of X-Linked Recessive Traits 80
 - Color blindness is an X-linked recessive trait. 80
 - Muscular dystrophy is an X-linked recessive trait. 82
- 4.9 Paternal Inheritance: Genes on the Y Chromosome 83
 - Spotlight on ... Hemophilia, HIV, and AIDS 84
- 4.10 Maternal Inheritance: Mitochondrial Genes 84
- 4.11 Variations in Gene Expression 85
 - Gene expression often changes with age. 85
 - Genetics in Society: Hemophilia and History* 86
 - Penetrance and expressivity cause variations in gene expression. 87

Chapter 5: Complex Patterns of Inheritance 94

- 5.1 Some Traits Are Controlled by Two or More Genes 95
 - Phenotypes can be discontinuous or continuous. 95
 - How are complex traits defined? 96
 - Assessing interaction of genes, environment, and phenotype can be difficult. 97
- 5.2 Polygenic Traits and Variation in Phenotype 97
 - Human eye color is a polygenic trait. 99
 - Averaging out the phenotype is called regression to the mean. 100
- 5.3 Multifactorial Traits: Polygenes and the Environment 100
 - Genetic Journeys: Is Autism a Genetic Disorder?* 101
 - Several methods are used to study multifactorial traits. 102
 - The interaction between genotype and environment can be estimated. 103
- 5.4 Heritability Measures the Genetic Contribution to Phenotypic Variation 103
 - Heritability estimates are based on known levels of genetic relatedness. 103
 - Fingerprints can be used to estimate heritability. 103
- 5.5 Twin Studies and Multifactorial Traits 104
 - The biology of twins includes monozygotic and dizygotic twins. 105
 - Concordance can occur in twins. 105
 - Genetic Journeys: Twins, Quintuplets, and Armadillos* 106
 - We can study obesity with twins and families. 107
 - What are some genetic clues to obesity? 108
 - Spotlight on ... Leptin and Female Athletes 109
- 5.6 A Survey of Some Multifactorial Traits 109
 - Cardiovascular disease has genetic and environmental components. 110
 - Skin color is a multifactorial trait. 112
 - Intelligence and intelligence quotient (IQ): are they related? 112
 - Spotlight on ... Building a Smarter Mouse 113
 - IQ values are heritable. 113
 - What is the controversy about IQ and race? 113
 - Scientists are searching for genes that control intelligence. 115

Chapter 6: Cytogenetics: Karyotypes and Chromosome Aberrations 120

- 6.1 The Human Chromosome Set 121
- 6.2 Making a Karyotype 123
- 6.3 Constructing and Analyzing Karyotypes 126
 - What cells are obtained for chromosome studies? 128
 - Amniocentesis collects cells from the fluid surrounding the fetus. 128
 - Chorionic villus sampling retrieves fetal tissue from the placenta. 128
- 6.4 Variations in Chromosome Number 130
 - Genetic Journeys: Using Fetal Cells from the Mother's Blood* 130
 - Polyploidy changes the number of chromosomal sets. 131
 - Aneuploidy changes the number of individual chromosomes. 132
 - Autosomal monosomy is a lethal condition. 133
 - Autosomal trisomy is relatively common. 133
- 6.5 What Are the Risks for Autosomal Trisomy? 135
 - Maternal age is the leading risk factor for trisomy. 135
 - Why is maternal age a risk factor? 136
- 6.6 Aneuploidy of the Sex Chromosomes 137
 - Turner syndrome (45,X) 137

- Klinefelter syndrome (47,XXY) 138
- XYY syndrome (47,XYY) 139
- What are some conclusions about aneuploidy of the sex chromosomes? 139

- 6.7 **Structural Alterations within Chromosomes** 139
 - Deletions involve loss of chromosomal material. 140
 - Translocations involve exchange of chromosomal parts. 141
- 6.8 **What Are Some Consequences of Aneuploidy?** 142
- 6.9 **Other Forms of Chromosomal Abnormalities** 144
 - Uniparental disomy 144
 - Fragile sites appear as gaps or breaks in chromosomes. 144

Chapter 7: Development and Sex Determination 150

- 7.1 **The Human Reproductive System** 151
 - The male reproductive system 151
 - The female reproductive system 154
 - Spotlight on ... The Largest Cell 156
 - What is the timing of meiosis and gamete formation in males and females? 156
- 7.2 **A Survey of Human Development from Fertilization to Birth** 157
 - Development is divided into three trimesters. 158
 - Birth is hormonally induced. 162
- 7.3 **Teratogens Are a Risk to the Developing Fetus** 162
 - Radiation, viruses, and chemicals can be teratogens. 162
 - Fetal alcohol syndrome is a preventable tragedy. 163
- 7.4 **How Is Sex Determined?** 164
 - Chromosomes can help determine sex. 164
 - The sex ratio in humans changes with stages of life. 165
- 7.5 **Defining Sex in Stages: Chromosomes, Gonads, and Hormones** 166
 - Sex differentiation begins in the embryo. 166
 - Hormones help shape male and female phenotypes. 168
- 7.6 **Mutations Can Uncouple Chromosomal Sex from Phenotypic Sex** 169
 - Hermaphrodites have male and female gonads. 169
 - Androgen insensitivity can affect the sex phenotype. 169
 - Sex phenotypes can change at puberty. 169
 - Genetic Journeys: Sex Testing in the Olympics—Biology and a Bad Idea* 170
- 7.7 **Equalizing the Expression of X Chromosomes in Males and Females** 171
 - Dosage compensation equalizes the expression of genes on the X chromosome. 171
 - Mice, Barr bodies, and X inactivation can help explain dosage compensation. 171
 - Genetics in Society: Joan of Arc—Was It Really John of Arc?* 172
 - Females can be mosaics for X-linked genes. 172
 - How and when are X chromosomes inactivated? 173
- 7.8 **Sex-Influenced and Sex-Limited Traits** 174

Chapter 8: DNA Structure and Chromosomal Organization 178

- 8.1 **DNA Carries Genetic Information** 179
 - DNA transfers genetic traits between bacterial strains. 180
 - Replication of bacterial viruses involves DNA. 181
- 8.2 **Watson, Crick, and the Structure of DNA** 183
 - Genetics in Society: DNA for Sale* 183

Understanding the structure of DNA requires a review of some basic chemistry. 184

Nucleotides are the building blocks of nucleic acids. 185

Polynucleotides are directional molecules. 185

8.3 DNA Contains Two Polynucleotide Chains 187

Spotlight on . . . DNA Organization and Disease 190

8.4 RNA Is a Single-Stranded Nucleic Acid 190

8.5 From DNA Molecules to Chromosomes 190

The mitochondrial chromosome is a circular DNA molecule. 190

Nuclear chromosomes have a complex structure. 191

The nucleus has a highly organized architecture. 191

8.6 DNA Replication Depends on Complementary Base Pairing 192

Chapter 9: Gene Expression: From Genes to Proteins 198

9.1 The Link between Genes and Proteins 199

Genes are linked to metabolism. 199

What is the relationship between genes and enzymes? 200

9.2 Genetic Information Is Stored in DNA 200

9.3 The Genetic Code: The Key to Life 201

9.4 Tracing the Flow of Genetic Information from Nucleus to Cytoplasm 202

9.5 Transcription Produces Genetic Messages 203

Most human genes have a complex internal organization. 204

Messenger RNA is processed and spliced. 204

9.6 Translation Requires the Interaction of Several Components 205

Spotlight on . . . Mutations in Splicing Sites and Genetic Disorders 206

Genetic Journeys: Antibiotics and Protein Synthesis 207

Translation produces proteins from information in mRNA. 208

9.7 Polypeptides Fold into Three-Dimensional Shapes to Form Proteins 210

9.8 Protein Structure and Function Are Related 210

Protein folding can be a factor in diseases. 211

Proteins have many functions. 212

Chapter 10: From Proteins to Phenotypes 218

10.1 Proteins Are the Link between Genes and the Phenotype 219

10.2 Enzymes and Metabolic Pathways 220

10.3 Phenylketonuria: A Mutation That Affects an Enzyme 221

Spotlight on . . . Why Wrinkled Peas Are Wrinkled 222

How is the metabolism of phenylalanine related to PKU? 222

PKU can be treated with a diet low in phenylalanine. 222

Genetic Journeys: Garrod and Metabolic Disease 223

What happens when women with PKU have children of their own? 225

10.4 Other Metabolic Disorders in the Phenylalanine Pathway 225

10.5 Genes and Enzymes of Carbohydrate Metabolism 226

Galactosemia is caused by an enzyme deficiency. 227

Lactose intolerance is a genetic variation. 228

- 10.6 Mutations in Receptor Proteins 228
- 10.7 Defects in Transport Proteins: Hemoglobin 229
 - Sickle cell anemia is an autosomal recessive disorder. 231
 - Thalassemias are also inherited hemoglobin disorders. 232
 - Hemoglobin disorders can be treated through gene switching. 234
- 10.8 Pharmacogenetics 235
 - Taste and smell differences: we live in different sensory worlds. 236
 - Drug sensitivities are genetic traits. 237
- 10.9 Ecogenetics 238
 - What is ecogenetics? 238
 - Pesticide metabolism is linked to resistance to nerve gases. 238

Chapter 11: Mutation: The Source of Genetic Variation 244

- 11.1 Mutations Are Heritable Changes 245
- 11.2 Mutations Can Be Detected in Several Ways 246
- 11.3 Measuring Spontaneous Mutation Rates 247
 - Mutation rates for specific genes can sometimes be measured. 248
 - Why do genes have different mutation rates? 249
- 11.4 Environmental Factors Influence Mutation Rates 249
 - Radiation is one source of mutations. 249
 - How much radiation are we exposed to? 250
 - Genetics in Society: Rise of the Flame Retardants* 251
 - Chemicals can cause mutations. 252
 - Spotlight on . . . Population Genetics of Sickle Cell Genes 254
- 11.5 Mutations at the Molecular Level: DNA as a Target 254
 - Many hemoglobin mutations are caused by nucleotide substitutions. 254
 - Mutations can be caused by nucleotide deletions and insertions. 255
 - Genetic Journeys: The First Molecular Disease* 256
 - Trinucleotide repeats and gene expansions are types of mutations. 257
 - Gene expansion is related to anticipation. 258
- 11.6 Mutations and DNA Damage Can Be Repaired 259
 - Cells have several DNA repair systems. 259
 - Genetic disorders can affect DNA repair systems. 260
- 11.7 Mutations, Genotypes, and Phenotypes 261
- 11.8 The Position of a Mutation in a Gene Is Important 261
- 11.9 Genomic Imprinting Is a Reversible Alteration of the Genome 262

Chapter 12: Genes and Cancer 268

- 12.1 Cancer Is a Genetic Disorder 269
- 12.2 Cancer Begins in a Single Cell 270
- 12.3 Inherited Susceptibility and Sporadic Cancers 270
- 12.4 Cancer Is a Disease of the Cell Cycle 272
 - Retinoblastoma is caused by mutation of a tumor suppressor gene. 273
 - Mutations in oncogenes cause cancer. 274
 - How do proto-oncogenes become oncogenes? 274
 - Spotlight on . . . Male Breast Cancer 275
 - Mutations in specific genes can predispose women to breast cancer. 275
 - BRCA1* and *BRCA2* are DNA repair genes. 276

- 12.5 Colon Cancer Is a Genetic Model for Cancer 276
 FAP can be related to colon cancer. 277
 HNPCC can be related to colon cancer. 278
 Gatekeeper genes and caretaker genes have provided insights from colon cancer. 279
- 12.6 Chromosome Changes, Hybrid Genes, and Cancer 280
 Chromosome rearrangements can be related to leukemia. 280
 Translocations and hybrid genes can lead to leukemias. 281
 New cancer drugs are being designed. 282
- 12.7 Cancer and the Environment 283
 What are some environmental factors for cancer? 284
Genetics in Society: The Skin Cancer Epidemic 285

Chapter 13: An Introduction to Cloning and Recombinant DNA 290

- 13.1 What Are Clones? 291
 Plants can be cloned from single cells. 291
 Animals can be cloned by several methods. 292
- 13.2 Cloning Genes Is a Multistep Process 294
 Restriction enzymes cut DNA at specific sites. 295
 Vectors serve as carriers of DNA. 298
 There are several steps in the process of cloning DNA. 298
 Spotlight on ... Cloning Endangered Species 301
- 13.3 Cloned Libraries 301
Genetics in Society: Asilomar: Scientists Get Involved 302
- 13.4 Finding a Specific Clone in a Library 303
- 13.5 A Revolution in Cloning: The Polymerase Chain Reaction 304
- 13.6 Analyzing Cloned Sequences 306
 The Southern blot technique can be used to analyze cloned sequences. 306
 DNA sequencing can be done for an entire genome. 307
Genetic Journeys: DNA Sequencing 310

Chapter 14: Biotechnology and Society 314

- 14.1 Biopharming: Making Medical Molecules in Animals and Plants 316
 Human proteins can be made in animal hosts. 317
 Biopharming can be used to make edible vaccines. 318
- 14.2 Genetically Modified Foods 319
 Transgenic crop plants can be made resistant to herbicides and disease. 320
 Spotlight on ... Bioremediation: Using Bugs to Clean Up Waste Sites 321
 Transgenic crops can be used to enhance the nutritional value of plants. 322
 What are some concerns about genetically modified organisms? 322
- 14.3 Transgenic Animals as Models of Human Diseases 323
 What is the process for making transgenic animals? 323
 Scientists use animal models to study human diseases. 324
- 14.4 Testing for Genetic Disorders 324
 Newborn screening is universal in the United States. 325
 Both carrier and prenatal testing are done to screen for genetic disorders. 325
 Prenatal testing can diagnose sickle cell anemia. 326
 Embryos can be tested for genetic disorders. 326
 Prenatal testing is associated with some risks. 327

- Genetics in Society: Who Owns a Genetic Test?* 328
- Presymptomatic testing can be done for some genetic disorders. 329

14.5 DNA Microarrays in Genetic Testing 329

14.6 DNA Profiles as Tools for Identification 331

- DNA profiles can be made from short tandem repeats (STRs). 331
- DNA profiles are used in the courtroom. 331
- DNA profiles have many other uses. 333
- Genetic Journeys: Death of a Czar* 334

14.7 Social and Ethical Questions about Biotechnology 335

Chapter 15: The Human Genome Project and Genomics 342

15.1 Genomic Sequencing Is an Extension of Genetic Mapping 343

- Recombination frequencies are used to make genetic maps. 344
- Recombinant DNA technology radically changed gene-mapping efforts. 345

15.2 Origins of the Human Genome Project 346

15.3 Genome Projects Have Created New Scientific Fields 348

15.4 Genomics: Sequencing, Identifying, and Mapping Genes 349

- Scientists can analyze genomic information with bioinformatics. 350
- Annotation is used to find where the genes are. 351
- Geneticists work to discover gene functions and gene products. 352

15.5 What Have We Learned So Far about the Human Genome? 353

- Spotlight on . . . Our Genetic Relative 354

15.6 Using Genomics and Bioinformatics to Study a Human Genetic Disorder 355

15.7 Proteomics Is an Extension of Genomics 356

15.8 Ethical Concerns about Human Genomics 356

15.9 Looking Beyond the Genome Project: What the Future Holds 357

- Genetics in Society: Who Owns Your Genome?* 358

Chapter 16: Reproductive Technology, Gene Therapy, and Genetic Counseling 364

16.1 Gaining Control over Reproduction 365

- Contraception uncouples sex from pregnancy. 365
- Surgery can prevent gamete transport. 366
- Blocking egg production controls fertility. 366
- Physical and chemical barriers block fertilization. 366

16.2 Infertility Is a Common Problem 367

16.3 Assisted Reproductive Technologies (ART) Expand Childbearing Options 367

- Spotlight on . . . Fatherless Mice 368
- Spotlight on . . . Reproductive Technologies from the Past 370

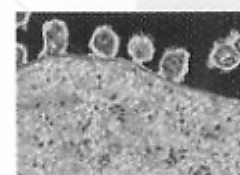

16.4 Ethical Issues in Reproductive Technology 370

- Reproductive technology carries risks to parents and children. 370
- Selecting siblings to be donors is a possibility. 370
- Genetics in Society: The Business of Making Babies* 371
- Genetic Journeys: Saving Cord Blood* 372

- 16.5 Gene Therapy Promises to Correct Many Disorders 372**
 What are the strategies for gene transfer? 372
 Gene therapy showed early promise. 373
 Gene therapy has also experienced setbacks and restarts. 373
 Some gene therapy involves stem cells, gene targeting, and therapeutic cloning. 374
 There are ethical issues related to gene therapy. 374
- 16.6 Genetic Counseling Assesses Reproductive Risks 376**
 Who are genetic counselors? 376
 Why do people seek genetic counseling? 376
 How does genetic counseling work? 377
 What are some future directions in genetic counseling? 378

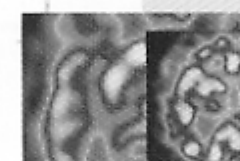

Chapter 17: Genes and the Immune System 382

- 17.1 The Immune System Defends the Body Against Infection 383**
- 17.2 The Complement System Kills Microorganisms 384**
- 17.3 The Inflammatory Response Is a General Reaction 384**
 Genetics can be related to inflammatory diseases. 386
- 17.4 The Immune Response Is a Specific Defense Against Infection 386**
 How does the immune response function? 386
 The antibody-mediated immune response involves several stages. 387
 Antibodies are molecular weapons against antigens. 390
 T cells mediate the cellular immune response. 391
 The immune system has a memory function. 393
- 17.5 Blood Types Are Determined by Cell-Surface Antigens 393**
 ABO blood typing allows safe blood transfusions. 394
 Rh blood types can cause immune reactions between mother and fetus. 395
- 17.6 Organ Transplants Must Be Immunologically Matched 396**
 Successful transplants depend on *HLA* matching. 397
 Genetic engineering makes animal–human organ transplants possible. 397
 Spotlight on . . . Genetically Engineered Blood 397
- 17.7 Disorders of the Immune System 398**
 Overreaction in the immune system causes allergies. 398
Genetic Journeys: Peanut Allergies Are Increasing 400
 Autoimmune reactions cause the immune system to attack the body. 401
 Genetic disorders can impair the immune system. 401
 HIV attacks the immune system. 402

Chapter 18: Genetics of Behavior 408

- 18.1 Models, Methods, and Phenotypes in Studying Behavior 409**
 There are several genetic models of inheritance and behavior. 410
 Methods of studying behavior genetics often involve twin studies. 410
 Phenotypes: How is behavior defined? 410
Genetic Journeys: Is Going to Medical School a Genetic Trait? 411
 The nervous system is the focus of behavior genetics. 412
- 18.2 Animal Models: The Search for Behavior Genes 412**
 Some behavioral geneticists study open-field behavior in mice. 412
 Transgenic animals are used as models of human neurodegenerative disorders. 413
- 18.3 Single Genes Affect the Nervous System and Behavior 414**
 Huntington disease is a model for neurodegenerative disorders. 414
 The link between language and brain development is still being explored. 416

18.4 Single Genes Control Aggressive Behavior and Brain Metabolism	417
Geneticists have mapped a gene for aggression.	418
There are problems with single-gene models for behavioral traits.	419
18.5 The Genetics of Mood Disorders and Schizophrenia	419
Mood disorders include unipolar and bipolar illnesses.	420
Schizophrenia has a complex phenotype.	422
18.6 Genetics and Social Behavior	424
Tourette syndrome affects speech and behavior.	424
Alzheimer disease has genetic and nongenetic components.	424
Alcoholism has several components.	426
Is sexual orientation a multifactorial trait?	427
18.7 Summing Up: The Current Status of Human Behavior Genetics	428

Chapter 19: Population Genetics and Human Evolution 434

19.1 The Population as a Genetic Reservoir	435
19.2 How Can We Measure Allele Frequencies in Populations?	436
Codominant allele frequencies can be measured directly.	437
Spotlight on . . . Selective Breeding Gone Bad	438
Recessive allele frequencies cannot be measured directly.	438
19.3 The Hardy-Weinberg Law Measures Allele and Genotype Frequencies	438
What are the assumptions for the Hardy-Weinberg Law?	439
How can we calculate allele and genotype frequencies?	439
19.4 Using the Hardy-Weinberg Law in Human Genetics	440
The Hardy-Weinberg Law measures the frequency of autosomal dominant and recessive alleles.	440
The Hardy-Weinberg Law estimates the frequency of heterozygotes in a population.	441
19.5 Measuring Genetic Diversity in Human Populations	443
Mutation generates new alleles but has little impact on allele frequency.	443
Genetic drift can change allele frequencies.	444
Natural selection acts on variation in populations.	445
19.6 Natural Selection Affects the Frequency of Genetic Disorders	446
<i>Genetics in Society: Lactose Intolerance and Culture</i>	447
19.7 Genetic Variation in Human Populations	447
How can we measure gene flow between populations?	447
<i>Genetics in Society: Genghis Khan Lives On</i>	448
Are there human races?	449
What are the implications of human genetic variation?	451
19.8 The Appearance and Spread of Our Species (<i>Homo sapiens</i>)	451
Two theories differ on how and where <i>Homo sapiens</i> originated.	451
Humans have spread across the world.	452

Appendix Answers to Selected Questions and Problems A-1

Glossary G-1
