<i>Detailed Contents</i>	xv
<i>Special Sections</i>	xxiv

PART 1 THE FACTS OF LIFE

Chapter 1:	Why: Biology by the Numbers	3
Chapter 2:	What and Where: Construction Plans for Cells and Organisms	29
Chapter 3:	When: Stopwatches at Many Scales	75
Chapter 4:	Who: "Bless the Little Beasties"	119

PART 2 LIFE AT REST

Chapter 5:	Mechanical and Chemical Equilibrium in the Living Cell	167
Chapter 6:	Entropy Rules!	215
Chapter 7:	Two-State Systems: From Ion Channels to Cooperative Binding	257
Chapter 8:	Random Walks and the Structure of Macromolecules	281
Chapter 9:	Electrostatics for Salty Solutions	327
Chapter 10:	Beam Theory: Architecture for Cells and Skeletons	357
Chapter 11:	Biological Membranes: Life in Two Dimensions	407

PART 3 LIFE IN MOTION

Chapter 12:	The Mathematics of Water	457
Chapter 13:	A Statistical View of Biological Dynamics	481
Chapter 14:	Life in Crowded and Disordered Environments	513
Chapter 15:	Rate Equations and Dynamics in the Cell	539
Chapter 16:	Dynamics of Molecular Motors	589
Chapter 17:	Biological Electricity and the Hodgkin-Huxley Model	647

PART 4 THE MEANING OF LIFE

Chapter 18:	Sequences, Specificity, and Evolution	681
Chapter 19:	Network Organization in Space and Time	721
Chapter 20:	Whither Physical Biology?	775

<i>Index</i>	787
--------------	-----

DETAILED CONTENTS

Part 1 THE FACTS OF LIFE 1

Chapter 1 Why: Biology by the Numbers 3

1.1	PHYSICAL BIOLOGY OF THE CELL	3
	Model Building Requires a Substrate of Biological Facts and Physical (or Chemical) Principles	4
1.2	THE STUFF OF LIFE	4
	Organisms Are Constructed from Four Great Classes of Macromolecules	5
	Nucleic Acids and Proteins Are Polymer Languages with Different Alphabets	6
1.3	MODEL BUILDING IN BIOLOGY	9
1.3.1	Models as Idealizations	9
	Biological Stuff Can Be Idealized Using Many Different Physical Models	10
1.3.2	Cartoons and Models	15
	Biological Cartoons Select Those Features of the Problem Thought to be Essential	15
	Quantitative Models Can Be Built by Mathematicizing the Cartoons	18
1.4	QUANTITATIVE MODELS AND THE POWER OF IDEALIZATION	19
1.4.1	On the Springiness of Stuff	19
1.4.2	The Toolbox of Fundamental Physical Models	20
1.4.3	The Role of Estimates	22
1.4.4	On Being Wrong	23
1.4.5	Rules of Thumb: Biology by the Numbers	25
1.5	SUMMARY AND CONCLUSIONS	25
1.6	FURTHER READING	27
1.7	REFERENCES	27

Chapter 2 What and Where: Construction Plans for Cells and Organisms 29

2.1	AN ODE TO <i>E. COLI</i>	29
2.1.1	The Bacterial Standard Ruler	30
	The Bacterium <i>E. coli</i> Will Serve as Our Standard Ruler	30
2.1.2	Taking the Molecular Census	32
	The Cellular Interior Is Highly Crowded with Mean Spacings Between Molecules That Are Comparable to Molecular Dimensions	36
2.1.3	Looking Inside Cells	37
2.1.4	Where Does <i>E. coli</i> Fit?	39
	Biological Structures Exist Over a Huge Range of Scales	39
2.2	CELLS AND STRUCTURES WITHIN THEM	40
2.2.1	Cells: A Rogue's Gallery	40
	Cells Come in a Wide Variety of Shapes and Sizes and with a Huge Range of Functions	41
	Cells from Humans Have a Huge Diversity of Structure and Function	45
2.2.2	The Cellular Interior: Organelles	47
2.2.3	Macromolecular Assemblies: The Whole is Greater than the Sum of the Parts	51
	Macromolecules Come Together to Form Assemblies	51
	Helical Motifs are Seen Repeatedly in Molecular Assemblies	51

	Macromolecular Assemblies Are Arranged in Superstructures	53
2.2.4	Viruses as Assemblies	53
2.2.5	The Molecular Architecture of Cells: From Protein Data Bank (PDB) Files to Ribbon Diagrams	57
	Macromolecular Structure Is Characterized Fundamentally by Atomic Coordinates	57
	Chemical Groups Allow Us to Classify Parts of the Structure of Macromolecules	58
2.3	TELESCOPING UP IN SCALE: CELLS DON'T GO IT ALONE	60
2.3.1	Multicellularity as One of Evolution's Great Inventions	61
	Bacteria Interact to Form Colonies such as Biofilms	61
	Teaming Up in a Crisis: Lifestyle of <i>Dictyostelium discoideum</i>	62
	Multicellular Organisms Have Many Distinct Communities of Cells	64
2.3.2	Cellular Structures from Tissues to Nerve Networks	65
	One Class of Multicellular Structures is the Epithelial Sheets	65
	Tissues Are Collections of Cells and Extracellular Matrix	66
	Nerve Cells Form Complex, Multicellular Complexes	66
2.3.3	Multicellular Organisms	67
	Cells Differentiate During Development Leading to Entire Organisms	68
	The Cells of the Nematode Worm <i>Caenorhabditis elegans</i> Have Been Charted Yielding a Cell-by-Cell Picture of the Organism	69
	Higher-Level Structures Exist as Colonies of Organisms	71
2.4	SUMMARY AND CONCLUSIONS	71
2.5	PROBLEMS	72
2.6	FURTHER READING	73
2.7	REFERENCES	73

Chapter 3 When: Stopwatches at Many Scales 75

3.1	THE HIERARCHY OF TEMPORAL SCALES	75
3.1.1	The Pageant of Biological Processes	77
	Biological Processes Are Characterized by a Huge Diversity of Time Scales	77
3.1.2	The Evolutionary Stopwatch	83
3.1.3	The Cell Cycle and the Standard Clock	87
	The <i>E. coli</i> Cell Cycle Will Serve as Our Standard Stopwatch	87
3.1.4	Three Views of Time in Biology	89
3.2	PROCEDURAL TIME	90
3.2.1	The Machines (or Processes) of the Central Dogma	90
	The Central Dogma Describes the Processes Whereby the Genetic Information Is Expressed Chemically	90
	The Processes of the Central Dogma Are Carried Out by Sophisticated Molecular Machines	91
3.2.2	Clocks and Oscillators	93
	Developing Embryos Divide on a Regular Schedule Dictated by an Internal Clock	94
	Diurnal Clocks Allow Cells and Organisms to Be on Time Everyday	94

3.3	RELATIVE TIME	97	General Ideas about Gene Regulation Were Learned from the Study of Viruses as a Model System	133
3.3.1	Checkpoints and the Cell Cycle	98	4.3.2 Bacteriophage and Modern Biophysics	134
	The Eukaryotic Cell Cycle Consists of Four Phases Involving Molecular Synthesis and Organization	98		
3.3.2	Measuring Relative Time	100	Many Single-Molecule Studies of Molecular Motors Have Been Performed on Motors from Bacteriophage	134
	Genetic Networks Are Collections of Genes Whose Expression Is Interrelated	100	4.4 A TALE OF TWO CELLS: <i>E. COLI</i> AS A MODEL SYSTEM	136
	The Formation of the Bacterial Flagellum Is Intricately Organized in Space and Time	101	4.4.1 Bacteria and Molecular Biology	136
3.3.3	Killing the Cell: The Life Cycles of Viruses	102	4.4.2 <i>E. coli</i> and the Central Dogma	136
	Viral Life Cycles Include a Series of Self-Assembly Processes	102	The Hypothesis of Conservative Replication Has Falsifiable Consequences	136
3.3.4	The Process of Development	104	Extracts from <i>E. coli</i> Were Used to Perform <i>In Vitro</i> Synthesis of DNA, mRNA, and Proteins	138
3.4	MANIPULATED TIME	106	4.4.3 The <i>lac</i> Operon as the "Hydrogen Atom" of Genetic Circuits	138
3.4.1	Chemical Kinetics and Enzyme Turnover	107	Gene Regulation in <i>E. coli</i> Serves as a Model for Genetic Circuits in General	138
3.4.2	Beating the Diffusive Speed Limit	108	The <i>lac</i> Operon Is a Genetic Network Which Controls the Production of the Enzymes Responsible for Digesting the Sugar Lactose	139
	Diffusion Is the Random Motion of Microscopic Particles in Solution	109	4.4.4 Signaling and Motility: The Case of Bacterial Chemotaxis	140
	Diffusion Times Depend upon the Length Scale	109	<i>E. coli</i> Has Served as a Model System for the Analysis of Cell Motility	140
	Molecular Motors Move Cargo over Large Distances in a Directed Way	110	4.5 YEAST: FROM BIOCHEMISTRY TO THE CELL CYCLE	142
	Membrane Bound Proteins Transport Molecules from One Side of a Membrane to the Other	112	Yeast Has Served as a Model System Leading to Insights in Contexts Ranging from Vitalism to the Functioning of Enzymes to Eukaryotic Gene Regulation	142
3.4.3	Beating the Replication Limit	113	4.5.1 Yeast and the Rise of Biochemistry	143
3.4.4	Eggs and Spores: Planning for the Next Generation	114	4.5.2 Dissecting the Cell Cycle	144
3.5	SUMMARY AND CONCLUSIONS	115	4.5.3 Deciding Which Way Is Up: Yeast and Polarity	145
3.6	PROBLEMS	115	4.5.4 Dissecting Membrane Traffic	147
3.7	FURTHER READING	117	4.5.5 Genomics and Proteomics	148
3.8	REFERENCES	117	4.6 FLIES AND MODERN BIOLOGY	151
Chapter 4 Who: "Bless the Little Beasties"	119		4.6.1 Flies and the Rise of Modern Genetics	151
4.1 CHOOSING A GRAIN OF SAND	119		<i>Drosophila melanogaster</i> Has Served as a Model System for Studies Ranging from Genetics to Development to the Functioning of the Brain and Even Behavior	151
	Modern Genetics Began with the Use of Peas as a Model System	120	4.6.2 How the Fly Got His Stripes	152
4.1.1 Biochemistry and Genetics	120		4.7 OF MICE AND MEN	154
4.2 HEMOGLOBIN AS A MODEL PROTEIN	124		4.8 THE CASE FOR EXOTICA	155
4.2.1 Hemoglobin, Receptor—Ligand Binding, and the Other Bohr	125		4.8.1 Specialists and Experts	155
	The Binding of Oxygen to Hemoglobin Has Served as a Model System for Ligand—Receptor Interactions More Generally	125	4.8.2 The Squid Giant Axon and Biological Electricity	157
	Quantitative Analysis of Hemoglobin Is Based upon Measuring the Fractional Occupancy of the Oxygen Binding Sites as a Function of Oxygen Pressure	125	There Is a Steady-State Potential Difference Across the Membrane of Nerve Cells	157
4.2.2 Hemoglobin and the Origins of Structural Biology	126		Nerve Cells Propagate Electrical Signals and Use Them to Communicate with Each Other	159
	The Study of the Mass of Hemoglobin Was Central in the Development of Centrifugation	127	4.8.3 Exotica Toolkit	159
	Structural Biology Has Its Roots in the Determination of the Structure of Hemoglobin	127	4.9 SUMMARY AND CONCLUSIONS	160
4.2.3 Hemoglobin and Molecular Models of Disease	127		4.10 PROBLEMS	161
4.2.4 The Rise of Allosteric and Cooperativity	128		4.11 FURTHER READING	162
4.3 BACTERIOPHAGE AND MOLECULAR BIOLOGY	129		4.12 REFERENCES	164
4.3.1 Bacteriophage and the Origins of Molecular Biology	129			
	Bacteriophage Have Sometimes Been Called the "Hydrogen Atoms of Biology"	129		
	Experiments on Phage and Their Bacterial Hosts Demonstrated That Natural Selection Is Operative in Microscopic Organisms	130		
	The Hershey—Chase Experiment Both Confirmed the Nature of Genetic Material and Elucidated One of the Mechanisms of Viral DNA Entry into Cells	130		
	Experiments on Phage T4 Demonstrated the Sequence Hypothesis of Collinearity of DNA and Proteins	131		
	The Triplet Nature of the Genetic Code and DNA Sequencing were Carried Out on Phage Systems	132		
	Phage Were Instrumental in Elucidating the Existence of mRNA	133		

Part 2 LIFE AT REST 165

Chapter 5 Mechanical and Chemical Equilibrium in the Living Cell 167

5.1	ENERGY AND THE LIFE OF CELLS	167
5.1.1	The Interplay of Deterministic and Thermal Forces	168
	Thermal Jostling of Particles Must Be Accounted for in Biological Systems	169
5.1.2	Constructing the Cell: Managing the Mass and Energy Budget of the Cell	170

5.2	BIOLOGICAL SYSTEMS AS MINIMIZERS	180	6.1.1	A First Look at Ligand—Receptor Binding	219
5.2.1	Equilibrium Models for Out of Equilibrium Systems	180	6.1.2	The Statistical Mechanics of Gene Expression: RNA Polymerase and the Promoter	222
	Equilibrium Models Can Be Used for Nonequilibrium Problems If Certain Processes Happen Much Faster than Others	180		A Simple Model of Gene Expression Is to Consider the Probability of RNA Polymerase Binding at the Promoter	224
5.2.2	Proteins in “Equilibrium”	182		Most Cellular RNA Polymerase Molecules Are Bound to DNA	224
	Protein Structures are Free-Energy Minimizers	183		The Binding Probability of RNA Polymerase to Its Promoter Is a Simple Function of the Number of Polymerase Molecules and the Binding Energy	226
5.2.3	Cells in “Equilibrium”	184	6.1.3	Classic Derivation of the Boltzmann Distribution	227
5.2.4	Mechanical Equilibrium from a Minimization Perspective	184		The Boltzmann Distribution Gives the Probability of Microstates for a System in Contact with a Thermal Reservoir	228
	The Mechanical Equilibrium State Is Obtained by Minimizing the Potential Energy	184	6.1.4	Boltzmann Distribution by Counting	230
5.3	THE MATHEMATICS OF SUPERLATIVES	187		Different Ways of Partitioning Energy Among Particles Have Different Degeneracies	230
5.3.1	The Mathematization of Judgement: Functions and Functionals	188	6.1.5	Boltzmann Distribution by Guessing	232
	Functionals Deliver a Number for Every Function They Are Given	188		Maximizing the Entropy Corresponds to Making a Best Guess When Faced with Limited Information	232
5.3.2	The Calculus of Superlatives	190		Entropy Maximization Can Be Used as a Tool for Statistical Inference	234
	Finding the Maximum and Minimum Values of a Function Requires That We Find Where the Slope of the Function Equals Zero	190		The Boltzmann Distribution Is the Maximum Entropy Distribution in Which the Average Energy Is Prescribed as a Constraint	236
5.4	CONFIGURATIONAL ENERGY	192	6.2	ON BEING IDEAL	237
	In Mechanical Problems, Potential Energy Determines the Equilibrium Structure	192	6.2.1	Average Energy of a Molecule in a Gas	238
5.4.1	Hooke’s Law: Actin to Lipids	195		The Ideal Gas Entropy Reflects the Freedom to Rearrange Molecular Positions and Velocities	238
	There Is a Linear Relation Between Force and Extension of a Beam	195	6.2.2	Free Energy of Dilute Solutions	240
	The Energy to Deform an Elastic Material Is a Quadratic Function of the Strain	196		The Chemical Potential of a Dilute Solution Is a Simple Logarithmic Function of the Concentration	240
5.5	STRUCTURES AS FREE ENERGY MINIMIZERS	198	6.2.3	Osmotic Pressure as an Entropic Spring	242
	The Entropy Is a Measure of the Microscopic Degeneracy of a Macroscopic State	198		Osmotic Pressure Arises from Entropic Effects	242
5.5.1	Entropy and Hydrophobicity	201		Viruses, Membrane-Bound Organelles and Cells are Subject to Osmotic Pressure	244
	Hydrophobicity Results from Depriving Water Molecules of Some of Their Configurational Entropy	201		Osmotic Forces Have Been Used to Measure the Interstrand Interactions of DNA	245
	Amino Acids Can Be Classified According to Their Hydrophobicity	203	6.3	THE CALCULUS OF EQUILIBRIUM APPLIED: LAW OF MASS ACTION	245
	When in Water, Hydrocarbon Tails on Lipids Have an Entropy Cost	203	6.3.1	Law of Mass Action and Equilibrium Constants	246
5.5.2	Gibbs and the Calculus of Equilibrium	204		Equilibrium Constants are Determined by Entropy Maximization	246
	Thermal and Chemical Equilibrium Are Obtained by Maximizing the Entropy	204	6.4	APPLICATIONS OF THE CALCULUS OF EQUILIBRIUM	248
5.5.3	Structure as a Competition	206	6.4.1	A Second Look at Ligand—Receptor Binding	248
	Free Energy Minimization Can Be Thought of as an Alternative Formulation of Entropy Maximization	207	6.4.2	Measuring Ligand—Receptor Binding	250
5.5.4	An Ode to ΔG	208	6.4.3	Beyond Simple Ligand—Receptor Binding: The Hill Function	250
	The Free Energy Reflects a Competition Between Energy and Entropy	208	6.4.4	ATP Power	252
5.6	SUMMARY AND CONCLUSIONS	209		The Energy Released in ATP Hydrolysis Depends Upon the Concentrations of Reactants and Products	253
5.7	APPENDIX: THE EULER—LAGRANGE EQUATIONS, FINDING THE SUPERLATIVE	210	6.5	SUMMARY AND CONCLUSIONS	254
	Finding the Extrema of Functionals Is Carried out Using the Calculus of Variations	210	6.6	PROBLEMS	254
	The Euler—Lagrange Equations Let Us Minimize Functionals by Solving Differential Equations	210	6.7	FURTHER READING	256
5.8	PROBLEMS	211	6.8	REFERENCES	256
5.9	FURTHER READING	213			
5.10	REFERENCES	214			
Chapter 6 Entropy Rules!		215	Chapter 7 Two-State Systems: From Ion Channels to Cooperative Binding		
6.1	THE ANALYTICAL ENGINE OF STATISTICAL MECHANICS	215	7.1	MACROMOLECULES WITH MULTIPLE STATES	257
	The Probability of Different Microstates Is Determined by Their Energy	217	7.1.1	The Internal State Variable Idea	257
				The State of a Protein or Nucleic Acid Can Be Characterized Mathematically Using a State Variable	258
			7.1.2	Ion Channels as an Example of Internal State Variables	260
				The Open Probability $\langle\sigma\rangle$ of an Ion Channel Can Be Computed Using Statistical Mechanics	261

7.2	STATE VARIABLE DESCRIPTION OF BINDING	264			
7.2.1	The Gibbs Distribution: Contact with a Particle Reservoir	264			
	The Gibbs Distribution Gives the Probability of Microstates for a System in Contact with a Thermal and a Particle Reservoir	264			
7.2.2	Simple Ligand—Receptor Binding Revisited	266			
7.2.3	Phosphorylation as an Example of Two Internal State Variables	267			
	Phosphorylation Can Change the Energy Balance Between Active and Inactive States	268			
7.2.4	Hemoglobin as a Case Study in Cooperativity	269			
	The Binding Affinity of Oxygen for Hemoglobin Depends upon Whether or Not Other Oxygens Are Already Bound	270			
	A Toy Model of a Dimeric Hemoglobin (Dimoglobin) Illustrates the Idea of Cooperativity	271			
	The Monod—Wyman—Changeux (MWC) Model Provides a Simple Example of Cooperative Binding	272			
	Statistical Models of the Occupancy of Hemoglobin Can Be Written Using Occupation Variables	274			
	There is a Logical Progression of Increasingly Complex Binding Models for Hemoglobin	274			
7.3	SUMMARY AND CONCLUSIONS	278			
7.4	PROBLEMS	278			
7.5	FURTHER READING	279			
7.6	REFERENCES	280			
Chapter 8 Random Walks and the Structure of Macromolecules		281			
8.1	WHAT IS A STRUCTURE: PDB OR R_G ?	281			
8.1.1	Deterministic vs Statistical Descriptions of Structure	282			
	PDB Files Reflect a Deterministic Description of Macromolecular Structure	282			
	Statistical Descriptions of Structure Emphasize Average Size and Shape Rather Than Atomic Coordinates	282			
8.2	MACROMOLECULES AS RANDOM WALKS	282			
	Random Walk Models of Macromolecules View Them as Rigid Segments Connected by Hinges	282			
8.2.1	A Mathematical Stupor	283			
	In Random Walk Models of Polymers, Every Macromolecular Configuration Is Equally Probable	283			
	The Mean Size of a Random Walk Macromolecule Scales as the Square Root of the Number of Segments, $\sqrt{N}$	283			
	The Probability of a Given Macromolecular Configuration Depends Upon Its Microscopic Degeneracy	285			
	Entropy Determines the Elastic Properties of Polymer Chains	286			
	The Persistence Length Is a Measure of the Length Scale Over Which a Polymer Remains Roughly Straight	289			
8.2.2	How Big Is a Genome?	291			
8.2.3	The Geography of Chromosomes	292			
	Genetic Maps and Physical Maps of Chromosomes Describe Different Aspects of Chromosome Structure	292			
	Different Structural Models of Chromatin Are Characterized by the Linear Packing Density of DNA	293			
	Spatial Organization of Chromosomes Shows Elements of Both Randomness and Order	294			
	Chromosomes Are Tethered at Different Locations	295			
	Chromosome Territories Have Been Observed in Bacterial Cells	298			
	Chromosome Territories in <i>Vibrio cholerae</i> Can Be Explored using Models of Polymer Confinement and Tethering	299			
8.2.4	DNA Looping: From Chromosomes to Gene Regulation	305			
	The Lac Repressor Molecule Acts Mechanistically by Forming a Sequestered Loop in DNA	306			
	Looping of Large DNA Fragments Is Dictated by the Difficulty of Distant Ends Finding Each Other	306			
8.2.5	PCR, DNA Melting, and DNA Bubbles	307			
	DNA Melting Is the Result of Competition Between the Energy Cost and the Entropy Gain of Separating the Two Complementary Strands	308			
	DNA Melting Temperatures Can Be Estimated Using a Random Walk Model	308			
8.3	THE NEW WORLD OF SINGLE-MOLECULE MECHANICS	311			
	Single-Molecule Measurement Techniques Lead to Force Spectroscopy	311			
8.3.1	Force—Extension Curves: A New Spectroscopy	311			
	Different Macromolecules Have Different Force Signatures When Subjected to Loading	311			
8.3.2	Random Walk Models for Force—Extension Curves	313			
	The Low-Force Regime in Force—Extension Curves Can Be Understood Using the Random Walk Model	313			
8.4	PROTEINS AS RANDOM WALKS	317			
8.4.1	Compact Random Walks and the Size of Proteins	318			
	The Compact Nature of Proteins Leads to an Estimate of their Size	318			
8.4.2	Hydrophobic and Polar Residues: The HP Model	318			
	The HP Model Divides Amino Acids into Two Classes: Hydrophobic and Polar	319			
8.4.3	HP Models of Protein Folding	321			
8.5	SUMMARY AND CONCLUSIONS	324			
8.6	PROBLEMS	324			
8.7	FURTHER READING	325			
8.8	REFERENCES	326			
Chapter 9 Electrostatics for Salty Solutions		327			
9.1	WATER AS LIFE'S AETHER	327			
9.2	THE CHEMISTRY OF WATER	329			
9.2.1	pH and the Equilibrium Constant	329			
	Dissociation of Water Molecules Reflects a Competition Between the Energetics of Binding and the Entropy of Charge Liberation	329			
9.2.2	The Charge on DNA and Proteins	330			
	The Charge State of Biopolymers Depends upon the pH of the Solution	330			
	Different Amino Acids Have Different Charge States	331			
9.2.3	Salt and Binding	331			
9.3	ELECTROSTATICS FOR SALTY SOLUTIONS	332			
9.3.1	An Electrostatics Primer	332			
	A Charge Distribution Produces an Electric Field Throughout Space	333			
	The Flux of the Electric Field Measures the Density of Electric Field Lines	333			
	The Electrostatic Potential Is an Alternative Basis for Describing the Electrical State of a System	336			
	There Is an Energy Cost Associated With Assembling a Collection of Charges	338			
	The Energy to Liberate Ions from Molecules Can Be Comparable to the Thermal Energy	340			
9.3.2	The Charged Life of a Protein	341			
9.3.3	The Notion of Screening: Electrostatics in Salty Solutions	342			
	Ions in Solution Are Spatially Arranged to Shield Charged Molecules Such as DNA	342			
	The Size of the Screening Cloud Is Determined by a Balance of Energy and Entropy of the Surrounding Ions	343			
9.3.4	The Poisson—Boltzmann Equation	346			
	The Distribution of Screening Ions Can Be Found by Minimizing the Free Energy	346			

9.3.5	The Screening Charge Decays Exponentially Around Macromolecules in Solution	348	10.5	THE CYTOSKELETON AND BEAM THEORY	388
	Viruses as Charged Spheres	349		Eukaryotic Cells Are Threaded by Networks of Filaments	388
9.4	SUMMARY AND CONCLUSION	352	10.5.1	The Cellular Interior: A Structural Perspective	388
9.5	PROBLEMS	353		Prokaryotic Cells Have Proteins Analogous to the Eukaryotic Cytoskeleton	391
9.6	FURTHER READING	355	10.5.2	Stiffness of Cytoskeletal Filaments	391
9.7	REFERENCES	355		The Cytoskeleton Can Be Viewed as a Collection of Elastic Beams	391
Chapter 10 Beam Theory: Architecture for Cells and Skeletons			357	10.5.3	Cytoskeletal Buckling
10.1	BEAMS ARE EVERYWHERE: FROM FLAGELLA TO THE CYTOSKELETON	357		A Beam Subject to a Large Enough Force Will Buckle	393
	One-Dimensional Structural Elements Are the Basis of Much of Macromolecular and Cellular Architecture	357	10.5.4	Estimate of the Buckling Force	395
10.2	GEOMETRY AND ENERGETICS OF BEAM DEFORMATION	359		Beam Buckling Occurs at Smaller Forces for Longer Beams	396
10.2.1	Stretch, Bend, and Twist	359	10.6	BEAMS AND BIOTECHNOLOGY	396
	Beam Deformations Result in Stretching, Bending, and Twisting	359	10.6.1	Biofunctionalized Cantilevers and Molecular Recognition	397
	A Bent Beam Can Be Analyzed as a Collection of Stretched Beams	359		Biofunctionalized Cantilevers Can Be Used to Detect Macromolecules, Viruses, and Cells	397
	The Energy Cost to Deform a Beam Is a Quadratic Function of the Strain	361		Bending of Biofunctionalized Cantilevers Reflects a Competition Between Bending Energy and Surface Free Energy	398
10.2.2	Beam Theory and the Persistence Length: Stiffness Is Relative	363	10.7	SUMMARY AND CONCLUSIONS	400
	Thermal Fluctuations Tend to Randomize the Orientation of Biological Polymers	363	10.8	APPENDIX: THE MATHEMATICS OF THE WORM-LIKE CHAIN	401
	The Persistence Length Is the Length Over Which a Polymer Is Roughly Rigid	363	10.9	PROBLEMS	403
	The Persistence Length Characterizes the Correlations in the Tangent Vectors at Different Positions Along the Polymer	364	10.10	FURTHER READING	405
	The Persistence Length Is Obtained by Averaging Over All Configurations of the Polymer	364	10.11	REFERENCES	406
10.2.3	Elasticity and Entropy: The Worm-like Chain	366	Chapter 11 Biological Membranes: Life in Two Dimensions		
	The Worm-like Chain Model Accounts for Both the Elastic Energy and Entropy of Polymer Chains	366	407		
10.3	THE MECHANICS OF TRANSCRIPTIONAL REGULATION: DNA LOOPING REDUX	368	11.1	THE NATURE OF BIOLOGICAL MEMBRANES	407
10.3.1	The <i>Lac</i> Operon and Other Looping Systems	368	11.1.1	Cells and Membranes	407
	Transcriptional Regulation Can Be Effected by DNA Looping	369		Cells and Their Organelles Are Bound by Complex Membranes	407
10.3.2	Energetics of DNA Looping	369		Electron Microscopy Provides a Window on Cellular Membrane Structures	409
10.3.3	Putting It All Together: The J-Factor	370	11.1.2	The Chemistry and Shape of Lipids	410
10.4	DNA PACKING: FROM VIRUSES TO EUKARYOTES	372		Membranes Are Built from a Variety of Molecules That Have an Ambivalent Relationship with Water	410
	The Packing of DNA in Viruses and Cells Requires Enormous Volume Compaction	372		The Shapes of Lipid Molecules Can Induce Spontaneous Curvature to Membranes	412
10.4.1	The Problem of Viral DNA Packing	374	11.1.3	The Liveliness of Membranes	414
	Structural Biologists Have Determined the Structure of Many Parts in the Viral Parts List	375		Membrane Proteins Shuttle Mass Across Membranes	415
	The Packing of DNA in Viruses Results in a Free-Energy Penalty	375		Membrane Proteins Communicate Information Across Membranes	416
	A Simple Model of DNA Packing in Viruses Uses the Elastic Energy of Circular Hoops	377		Specialized Membrane Proteins Generate ATP	416
	DNA Self-Interactions Are also Important in Establishing the Free Energy Associated with DNA Packing in Viruses	379		Membrane Proteins Can Be Reconstituted in Vesicles	417
	DNA Packing in Viruses Is a Competition Between Elastic and Interaction Energies	380	11.2	ON THE SPRINGINESS OF MEMBRANES	417
10.4.2	Constructing the Nucleosome	381	11.2.1	An Interlude on Membrane Geometry	417
	Nucleosome Formation Involves Both Elastic Deformation and Interactions between Histones and DNA	383		Membrane Stretching Geometry Can Be Described by a Simple Area Function	418
10.4.3	Equilibrium Accessibility of Nucleosomal DNA	383		Membrane Bending Geometry Can Be Described by a Simple Height Function, $h(x,y)$	419
	The Equilibrium Accessibility of Sites within the Nucleosome Depends upon How Far They Are from the Unwrapped Ends	384		Membrane Compression Geometry Can Be Described by a Simple Thickness Function, $w(x,y)$	422
				Membrane Shearing Can Be Described by an Angle Variable, θ	422
			11.2.2	Free Energy of Membrane Deformation	422
				There Is a Free Energy Penalty Associated with Changing the Area of a Lipid Bilayer	422
				There Is a Free Energy Penalty Associated with Bending a Lipid Bilayer	423
				There Is a Free Energy Penalty for Changing the Thickness of a Lipid Bilayer	424
				There Is an Energy Cost Associated with the Gaussian Curvature	424

11.3	STRUCTURE, ENERGETICS, AND FUNCTION OF VESICLES	426	12.4.3	Dissipative Time Scales and the Reynolds Number	471
11.3.1	Measuring Membrane Stiffness	426	12.4.4	Fish Gotta Swim, Birds Gotta Fly, and Bacteria Gotta Swim Too	472
	Membrane Elastic Properties Can Be Measured by Stretching Vesicles	426		Reciprocal Deformation of the Swimmer's Body Does Not Lead to Net Motion at Low Reynolds Number	474
11.3.2	Membrane Pulling	427	12.4.5	Centrifugation and Sedimentation: Spin It Down	475
11.3.3	Vesicles in Cells	431	12.5	SUMMARY AND CONCLUSIONS	477
	Vesicles Are Used for a Variety of Cellular Transport Processes	431	12.6	PROBLEMS	477
	There Is a Fixed Free-Energy Cost Associated with Spherical Vesicles of All Sizes	433	12.7	FURTHER READING	479
	Vesicle Formation Is Assisted by Budding Proteins	434	12.8	REFERENCES	479
	There Is an Energy Cost to Disassemble Coated Vesicles	435			
11.3.4	Fusion and Fission	435			
11.4	MEMBRANES AND SHAPE	436			
11.4.1	The Shapes of Organelles	437			
	The Surface Area of Membranes Due to Pleating Is So Large That Organelles Can Have Far More Area than the Plasma Membrane	437			
11.4.2	The Shapes of Cells	439			
	The Equilibrium Shapes of Red Blood Cells Can Be Found by Minimizing the Free Energy	441			
11.5	THE ACTIVE MEMBRANE	441			
11.5.1	Mechanosensitive Ion Channels and Membrane Elasticity	441			
	Mechanosensitive Ion Channels Respond to Membrane Tension	441			
11.5.2	Elastic Deformations of Membranes Produced by Proteins	443			
	Proteins Induce Elastic Deformations in the Surrounding Membrane	443			
	Protein-induced Membrane Bending Has an Associated Free-Energy Cost	444			
11.5.3	One-Dimensional Solution for MscL	444			
	Membrane Deformations Can Be Obtained by Minimizing the Membrane Free Energy	444			
	The Membrane Surrounding a Channel Protein Produces a Line Tension	446			
11.6	SUMMARY AND CONCLUSIONS	450			
11.7	PROBLEMS	450			
11.8	FURTHER READING	453

Chapter 13 A Statistical View of Biological Dynamics 481

13.1	DIFFUSION IN THE CELL	481
13.1.1	Active vs Passive Transport	482
13.1.2	Biological Distances Measured in Diffusion Times	482
	The Time It Takes a Diffusing Molecule to Travel a Distance L Grows as the Square of the Distance	484
	Diffusion Is Not Effective Over Large Cellular Distances	484
13.1.3	Random Walk Redux	486
13.2	CONCENTRATION FIELDS AND DIFFUSIVE DYNAMICS	487
	Fick's Law Tells Us How Mass Transport Currents Arise as a Result of Concentration Gradients	488
	The Diffusion Equation Results from Fick's Law and Conservation of Mass	490
13.2.1	Diffusion by Summing Over Microtrajectories	491
13.2.2	Solutions and Properties of the Diffusion Equation	496
	Concentration Profiles Broaden Over Time in a Very Precise Way	496
13.2.3	FRAP and FCS	498
13.2.4	Drunks on a Hill: The Smoluchowski Equation	502
13.2.5	The Einstein Relation	503
13.3	DIFFUSION TO CAPTURE	505
13.3.1	Modeling the Cell Signaling Problem	506
	Perfect Receptors Result in a Rate of Uptake $4\pi Dc_0a$	507
	A Distribution of Receptors Is Almost as Good as a Perfectly Absorbing Sphere	508
13.3.2	A "Universal" Rate for Diffusion-Limited Chemical Reactions	510
13.4	SUMMARY AND CONCLUSIONS	511
13.5	PROBLEMS	511
13.6	FURTHER READING	512
13.7	REFERENCES	512

Chapter 14 Life in Crowded and Disordered Environments 513

14.1	CROWDING, LINKAGE, AND ENTANGLEMENT	513
14.1.1	The Cell Is Crowded	514
14.1.2	Macromolecular Networks: The Cytoskeleton and Beyond	515
14.1.3	Crowding on Membranes	517
14.1.4	Consequences of Crowding	517
	Crowding Alters Biochemical Equilibria	517
	Crowding Alters the Kinetics within Cells	518
14.2	EQUILIBRIA IN CROWDED ENVIRONMENTS	520
14.2.1	Crowding and Binding	520
	Lattice Models of Solution Provide a Simple Picture of the Role of Crowding in Biochemical Equilibria	520
14.2.2	Osmotic Pressures in Crowded Solutions	523
	Osmotic Pressure Reveals Crowding Effects	523
14.2.3	Depletion Forces: Order from Disorder	524

Part 3 LIFE IN MOTION 455

Chapter 12 The Mathematics of Water 457

12.1	PUTTING WATER IN ITS PLACE	457
12.2	HYDRODYNAMICS OF WATER AND OTHER FLUIDS	458
12.2.1	Water as a Continuum	458
	Though Fluids Are Comprised of Molecules It Is Possible to Treat Them as a Continuous Medium	458
12.2.2	What Can Newton Tell Us?	458
	Gradients in Fluid Velocity Lead to Shear Forces	458
12.2.3	$F = ma$ for Fluids	460
12.2.4	The Newtonian Fluid and the Navier—Stokes Equations	463
	The Velocity of Fluids at Surfaces Is Zero	464
12.3	THE RIVER WITHIN: FLUID DYNAMICS OF BLOOD	464
12.3.1	Boats in the River: Leukocyte Rolling and Adhesion	466
12.4	THE LOW REYNOLDS NUMBER WORLD	468
12.4.1	Stokes Flow: Consider a Spherical Bacterium	468
12.4.2	Stokes Drag in Single-Molecule Experiments	470
	Stokes Drag Is Irrelevant for Optical Tweezers Experiments	470

The Close Approach of Large Particles Excludes Smaller Particles Between Them, Resulting in an Entropic Force	524	15.4.2 Rate Equation Description of Cytoskeletal Polymerization	575
Depletion Forces Can Induce Entropic Ordering!	529	Polymerization Reactions can be described by Rate Equations	575
14.2.4 Excluded Volume and Polymers	530	The Time Evolution of the Probability Distribution $P_n(t)$ can be Written Using a Rate Equation	577
Excluded Volume Leads to an Effective Repulsion between Molecules	530	Rates of Addition and Removal of Monomers Are Often Different on the Two Ends of Cytoskeletal Filaments	579
Self-avoidance Between the Monomers of a Polymer Leads to Polymer Swelling	531	15.4.3 Nucleotide Hydrolysis and Cytoskeletal Polymerization	581
14.3 CROWDED DYNAMICS	533	ATP Hydrolysis Sculpt the Molecular Interface Resulting in Distinct Rates at the Ends of Cytoskeletal Filaments	581
14.3.1 Crowding and Reaction Rates	533	15.4.4 Dynamic Instability: A Toy Model of the Cap	583
Enzymatic Reactions in Cells Can Proceed Faster than the Diffusion Limit Using Substrate Channeling	533	A Toy Model of Dynamic Instability Assumes That Catastrophe Occurs When Hydrolyzed Nucleotides Are Present at the Growth Front	583
Protein Folding Is Facilitated by Chaperones	534	15.5 SUMMARY AND CONCLUSIONS	586
14.3.2 Diffusion in Crowded Environments	535	15.6 PROBLEMS	587
14.4 SUMMARY AND CONCLUSIONS	536	15.7 FURTHER READING	588
14.5 PROBLEMS	537	15.8 REFERENCES	588
14.6 FURTHER READING	538		
14.7 REFERENCES	538		
Chapter 15 Rate Equations and Dynamics in the Cell	539	Chapter 16 Dynamics of Molecular Motors	589
15.1 BIOLOGICAL STATISTICAL DYNAMICS: A FIRST LOOK	539	16.1 THE DYNAMICS OF MOLECULAR MOTORS: LIFE IN THE FAST LANE	589
15.1.1 Cells as Chemical Factories	540	16.1.1 Translational Motors: Beating the Diffusive Speed Limit	591
15.1.2 Dynamics of the Cytoskeleton	541	The Motion of Eukaryotic Cilia and Flagella Is Driven by Translational Motors	594
15.2 A CHEMICAL PICTURE OF BIOLOGICAL DYNAMICS	545	Muscle Contraction Is Mediated by Myosin Motors	595
15.2.1 The Rate Equation Paradigm	545	16.1.2 Rotary Motors	600
Chemical Concentrations Vary in Both Space and Time	545	16.1.3 Polymerization Motors: Pushing by Growing	603
Rate Equations Describe the Time Evolution of Concentrations	546	16.1.4 Translocation Motors: Pushing by Pulling	603
15.2.2 All Good Things Must End	546	16.2 RECTIFIED BROWNIAN MOTION AND MOLECULAR MOTORS	605
Macromolecular Decay can be Described by a Simple, First-order Differential Equation	546	16.2.1 The Random Walk Yet Again	605
15.2.3 A Single-Molecule View of Degradation: Statistical Mechanics Over Trajectories	548	Molecular Motors Can Be Thought of as Random Walkers	605
Molecules Fall Apart with a Characteristic Lifetime	548	16.2.2 The One-state Model	606
Decay Processes Can Be Described with Two-state Trajectories	550	The Dynamics of a Molecular Motor Can Be Written Using a Master Equation	607
Decay of One Species Corresponds to Growth in the Number of a Second Species	551	The Driven Diffusion Equation Can Be Transformed into an Ordinary Diffusion Equation	609
15.2.4 Bimolecular Reactions	553	16.2.3 Motor Stepping from a Free-Energy Perspective	612
Chemical Reactions Can Increase the Concentration of a Given Species	553	16.2.4 The Two-state Model	616
Equilibrium Constants Have a Dynamical Interpretation in Terms of Reaction Rates	555	The Dynamics of a Two-State Motor Is Described by Two Coupled Rate Equations	617
15.2.5 Dynamics of Ion Channels as a Case Study	555	Internal States Reveal Themselves in the Form of the Waiting Time Distribution	620
Rate Equations for Ion Channels Characterize the Time Evolution of the Open and Closed Probability	556	16.2.5 More General Motor Models	622
15.2.6 Rapid Equilibrium	558	16.2.6 Coordination of Motor Protein Activity	624
Some Chemical Reactions Are Linked Together in a Sequence Resulting in Coupled Rate Equations	559	16.2.7 Rotary Motors	626
15.2.7 Michaelis—Menten and Enzyme Kinetics	563	16.3 POLYMERIZATION AND TRANSLOCATION AS MOTOR ACTION	629
15.3 THE CYTOSKELETON IS ALWAYS UNDER CONSTRUCTION	566	16.3.1 The Polymerization Ratchet	629
15.3.1 The Eukaryotic Cytoskeleton	566	The Polymerization Ratchet Is Based on a Polymerization Reaction That Is Maintained Out of Equilibrium	631
The Cytoskeleton Is a Dynamical Structure That Is Always Under Construction	566	The Polymerization Ratchet Force—Velocity Can Be Obtained by Solving a Driven Diffusion Equation	634
15.3.2 The Curious Case of the Bacterial Cytoskeleton	567	16.3.2 Force Generation by Growth	636
15.4 SIMPLE MODELS OF CYTOSKELETAL POLYMERIZATION	569	Polymerization Forces Can Be Measured Directly	636
The Dynamics of Polymerization Can Involve Many Distinct Physical and Chemical Effects	570	Polymerization Forces Are Used to Center Cellular Structures	638
15.4.1 The Equilibrium Polymer	571	16.3.3 The Translocation Ratchet	639
Equilibrium Models of Cytoskeletal Filaments Describe the Distribution of Polymer Lengths for Simple Polymers	571	Protein Binding Can Speed up Translocation through a Ratcheting Mechanism	639
An Equilibrium Polymer Fluctuates in Time	573	The Translocation Time Can Be Estimated by Solving a Driven Diffusion Equation	641

16.4	SUMMARY AND CONCLUSIONS	642	18.2.1	The HP Model as a Coarse-grained Model for Bioinformatics	688
16.5	PROBLEMS	643	18.2.2	Scoring Success	691
16.6	FURTHER READING	644		A Score Can Be Assigned to Different Alignments Between Sequences	691
16.7	REFERENCES	645		Comparison of Full Amino Acid Sequences Requires a 20 by 20 Scoring Matrix	692
Chapter 17 Biological Electricity and the Hodgkin—Huxley Model				Even Random Sequences Have a Nonzero Score	694
17.1	THE ROLE OF ELECTRICITY IN CELLS	647		The Extreme Value Distribution Determines the Probability That a Given Alignment Score Would Be Found by Chance	696
17.2	THE CHARGE STATE OF THE CELL	648		False Positives Increase as the Threshold for Acceptable Expect Values (also Called E-Values) Is Reduced	698
17.2.1	The Electrical Status of Cells and Their Membranes	648		Structural and Functional Similarity Do Not Always Guarantee Sequence Similarity	699
17.2.2	Electrochemical Equilibrium and the Nernst Equation	649	18.3	SEQUENCES AND EVOLUTION	701
	Ion Concentration Differences Across Membranes Lead to Potential Differences	649	18.3.1	Evolution by the Numbers: Hemoglobin as a Case Study in Sequence Alignment	702
17.3	MEMBRANE PERMEABILITY: PUMPS AND CHANNELS	651		Sequence Similarity Is Used as a Temporal Yardstick to Determine Evolutionary Distances	702
	A Nonequilibrium Charge Distribution Is Set Up Between the Cell Interior and the External World	651	18.3.2	Evolution and Drug Resistance	703
17.3.1	Ion Channels and Membrane Permeability	652	18.3.3	The Evolution of Viruses	706
	Ion Permeability Across Membranes Is Mediated by Ion Channels	654	18.3.4	Phylogenetic Trees	708
	A Simple Two-State Model Can Describe Many of the Features of Voltage Gating of Ion Channels	654	18.4	THE MOLECULAR BASIS OF FIDELITY	710
17.3.2	Maintaining a Nonequilibrium Charge State	656	18.4.1	Keeping It Specific: Beating Thermodynamic Specificity	711
	Ions Are Pumped Across the Cell Membrane Against an Electrochemical Gradient	656		The Specificity of Biological Recognition Often Far Exceeds the Limit Dictated by Free-Energy Differences	711
17.4	THE ACTION POTENTIAL	659		High Specificity Costs Energy	715
17.4.1	Membrane Depolarization: The Membrane as a Bistable Switch	659	18.5	SUMMARY AND CONCLUSIONS	717
	Coordinated Muscle Contraction Depends Upon Membrane Depolarization	659	18.6	PROBLEMS	717
	A Patch of Cell Membrane Can Be Modeled as an Electrical Circuit	661	18.7	FURTHER READING	719
	The Difference Between the Membrane Potential and the Nernst Potential Leads to an Ionic Current Across the Cell Membrane	663	18.8	REFERENCES	720
	Voltage-gated Channels Result in a Nonlinear Current—Voltage Relation for the Cell Membrane	663	Chapter 19 Network Organization in Space and Time		
	A Patch of Membrane Acts as a Bistable Switch	666	721		
	The Dynamics of Voltage Relaxation Can Be Modeled Using an RC Circuit	667	19.1	CHEMICAL AND INFORMATIONAL ORGANIZATION IN THE CELL	721
17.4.2	The Cable Equation	668		Many Chemical Reactions in the Cell are Linked in Complex Networks	721
17.4.3	Depolarization Waves	670		Genetic Networks Describe the Linkages Between Different Genes and Their Products	722
	Waves of Membrane Depolarization Rely on Sodium Channels Switching into the Open State	670		Developmental Decisions Are Made by Regulating Genes	723
17.4.4	Spikes	672		Gene Expression Is Measured Quantitatively in Terms of How Much, When, and Where	723
17.4.5	Hodgkin—Huxley and Membrane Transport	674	19.2	GENETIC NETWORKS: DOING THE RIGHT THING AT THE RIGHT TIME	726
	Inactivation of Sodium Channels Leads to Propagating Spikes	674		Promoter Occupancy Is Dictated by the Presence of Regulatory Proteins Called Transcription Factors	727
17.5	SUMMARY AND CONCLUSIONS	676	19.2.1	The Molecular Implementation of Regulation: Promoters, Activators, and Repressors	727
17.6	PROBLEMS	676		Repressor Molecules Are the Proteins That Implement Negative Control	727
17.7	FURTHER READING	677		Activators Are the Proteins That Implement Positive Control	729
17.8	REFERENCES	677		Genes Can Be Regulated During Processes Other Than Transcription	729
Part 4 THE MEANING OF LIFE				19.2.2	The Mathematics of Recruitment and Rejection
679					Recruitment of Proteins Reflects Cooperativity Between Different DNA Binding Proteins
Chapter 18 Sequences, Specificity, and Evolution					The Regulation Factor Dictates How the Bare RNA Polymerase Binding Probability Is Altered by Transcription Factors
681					Activator Bypass Experiments Show That Activators Work by Recruitment
18.1	BIOLOGICAL INFORMATION	681			Repressor Molecules Reduce the Probability Polymerase Will Bind to the Promoter
18.1.1	Why Sequences?	683			
18.1.2	Genomes and Sequences by the Numbers	683			
18.2	SEQUENCE ALIGNMENT AND HOMOLOGY	685			
	Sequence Comparison Can Sometimes Reveal Deep Functional and Evolutionary Relationships Between Genes, Proteins, and Organisms	686
