Introduction . . . 3

1. Poisonous and Hallucinogenic Mushrooms . . . 7
 2. Ergot and Ergotism . . . 34
 3. Mycotoxins and Mycotoxicoses: Aflatoxin . . . 59
 4. Mycotoxins and Mycotoxicoses: Other *Aspergillus* Species, *Penicillium*, and *Fusarium* . . . 86
 5. Airborne Fungus Spores, Plant Disease, and Respiratory Allergy . . . 114
 6. Fungus Predators and Parasites of Nematodes and Insects . . . 143
 7. Fungi Pathogenic in Man and Animals . . . 172
 8. Decay of Wood in Trees and Buildings . . . 200
 9. Fungi Past and Present . . . 229
- References . . . 249
- Subject Index . . . 257
- Index of Names, Including Authors Cited . . . 263

List of Illustrations

- Figure 1-1. *Amanita verna*, the extremely toxic fungus responsible for most cases of fatal mushroom poisoning . . . 13
- Figure 2-1. Ergot sclerotia in rye and wheat . . . 36
- Figure 2-2. Germinating ergot sclerotia . . . 38
- Figure 3-1. A rodent dropping and a small stone from a sample of "pure" black peppercorns . . . 74
- Figure 3-2. A "pure" black peppercorn cut in half and placed on agar, with *Aspergillus flavus* and *A. ochraceus* growing out . . . 75
- Figure 4-1. *Aspergillus ochraceus* growing out from the germ or embryo of a wheat kernel . . . 87
- Figure 4-2. Cobs of corn infected by *Fusarium roseum* . . . 101
- Figure 4-3. Vaginal prolapse resulting from consumption of corn in which *Fusarium roseum* had grown and had produced the estrogenic compound F-2 . . . 105
- Figure 6-1. A nematode captured by a predacious fungus . . . 148
- Figure 6-2. Fruiting stalks of *Cordyceps* growing up from the remains of a parasitized insect larva . . . 161
- Figures 6-3, 6-4, and 6-5. Fruiting structures of *Cordyceps*-like fungi growing out from parasitized insects . . . 162-163
- Figure 6-6. Fruiting structures of *Cordyceps* growing from a parasitized scale insect . . . 166
- Figure 7-1. A ringworm-caused concentric scaling lesion on a patient's arm . . . 174
- Figure 7-2. A man infected by *Coccidioides immitis* . . . 186
- Figure 8-1. Brown cubical heartrot in a living northern white cedar tree . . . 202
- Figure 8-2. Fruit bodies of *Polyporus rhodes* on a living oak tree, the heartwood of which is being decayed by this fungus . . . 204

Figure 8-3. Cross section of an aspen tree decayed by *Fomes ignarius* . . . 206

Figure 8-4. A fence post badly decayed after having been in service for three years at Cloquet, Minnesota, where the growing season is only about four months long . . . 221

Figure 8-5. A sign decayed to the point of collapse although the wood had been given heavy coats of varnish to "protect" it . . . 228

Color Plates, between pages 120 and 121

Plate 1. Colonies of fungi growing from "pure" black pepper scattered on agar

Plate 2. Fungi — mainly *Aspergillus flavus* — growing from elbow macaroni plated on agar

Plate 3. Several species of *Aspergillus* growing from a kernel of corn that developed damage in storage

Plate 4. *Aspergillus flavus* growing from the germ or embryo of a split kernel of corn that had been inoculated with the fungus

Plate 5. A halo of spores of *Empusa muscae*, shot off after the fungus had invaded and killed the fly

Plate 6. *Coprinus atramentarius*, one of the mushrooms that is toxic to some people if consumed along with alcohol

Plate 7. *Fomes applanatus* growing out from a tree

Plate 8. Fungus spores on the surface of a log
