Preface	x
Introduction	xiv
Chapter 1 Mutation	1
1.1 Types of mutations	1
1.1.1 Muller's classification of mutants	2
1.1.2 Modern mutant terminology	9
1.1.3 DNA-level terminology	10
1.2 Dominance and recessivity	11
1.2.1 Dominance and recessivity at the level of the cell	12
1.2.2 Difficulties in applying the terms "dominant" and "recessive" to sex-linked mutants	13
1.3 The genetic utility of dominant and recessive mutants	14
Summary	14
Gallery of model organisms	15
1.1 Our favorite organism: <i>Drosophila melanogaster</i>	15
1.2 Our second favorite organism: <i>Saccharomyces cerevisiae</i>	18
1.3 Our third favorite organism: <i>Caenorhabditis elegans</i>	19
1.4 Our new favorite organism: zebrafish	21
1.5 Phage lambda	23
1.6 Phage T4	25
1.7 <i>Arabidopsis thaliana</i>	27
1.8 <i>Mus musculus</i> (the mouse)	28
Chapter 2 Mutant hunts	31
2.1 Why look for new mutants?	32
2.1.1 Reason 1: To identify genes required for a specific biological process	32
2.1.2 Reason 2: To isolate more mutations in a specific gene of interest	35
2.1.3 Reason 3: To obtain mutations tools for structure–function analysis	38
2.1.4 Reason 4: To isolate mutations in a gene so far identified only by molecular approaches	38

2.2	Mutagenesis and mutational mechanisms	38
2.2.1	Method 1: Ionizing radiation (usually X-rays and gamma-rays)	39
2.2.2	Method 2: Chemical mutagens	40
2.2.3	Method 3: Transposons as mutagens	42
2.2.4	Method 4: Targeted gene disruption (a variant on transposon mutagenesis)	44
2.3	What phenotype should you screen (or select) for?	46
2.4	Actually getting started	47
2.4.1	Your starting material	47
2.4.2	Pilot screens	47
2.4.3	Keeping too many, keeping too few	48
2.4.4	How many mutants is enough?	48
	Summary	50
Box 2.1	A screen for embryonic lethal mutations in <i>Drosophila</i>	33
Box 2.2	The balancer chromosome	34–5
Box 2.3	A screen for sex-linked lethal mutations in <i>Drosophila</i>	36–7
Box 2.4	Making phenocopies by RNAi and co-suppression	45
Box 2.5	Reviews of mutant isolation schemes and techniques in various organisms	51–4
Chapter 3	The complementation test	55
3.1	The essence of the complementation test	55
3.2	Rules for using the complementation test	58
3.3	How might the complementation test lie to you?	60
3.4	Second-site non-complementation (SSNC) (non-allelic non-complementation)	61
3.4.1	Type 1 SSNC (poisonous interactions): the interaction is allele-specific at both loci	62
3.4.2	Type 2 SSNC (sequestration): the interaction is allele-specific at one locus	70
3.4.3	Type 3 SSNC (combined haplo-insufficiency): the interaction is allele-independent at both loci	76
3.4.4	Summary of SSNC	77
3.5	An extension of second-site non-complementation: dominant enhancers	79
3.5.1	A successful screen for dominant enhancers	79
	Summary	81
Box 3.1	A more rigorous definition of the complementation test	56
Box 3.2	An example of using the complementation test in yeast	57
Box 3.3	Transformation rescue is a variant of the complementation test	58
Box 3.4	One method for determining whether or not a dominant mutation is an allele of a given gene, or how to make dominants into recessives by pseudo-reversion	59
Box 3.5	Pairing-dependent complementation: transvection	62
Box 3.6	Synthetic lethality and genetic buffering	67–9

Chapter 4 Suppression	82
4.1 A basic definition of genetic suppression	82
4.2 Intragenic suppression (pseudo-reversion)	83
4.2.1 Intragenic revertants can mediate translational suppression	84
4.2.2 Intragenic suppression as a result of compensatory mutants	86
4.3 Extragenic suppression	88
4.4 Transcriptional suppression	88
4.4.1 Suppression at the level of gene expression	88
4.4.2 Suppression of transposon insertion mutants by altering the control of mRNA processing	89
4.4.3 Suppression of nonsense mutants by messenger stabilization in <i>C. elegans</i>	89
4.5 Translational suppression	90
4.5.1 Simplicity: tRNA suppressors in <i>E. coli</i>	90
4.5.2 The numerical and functional redundancy of tRNA genes allowing suppressor mutations to be viable	92
4.5.3 Suppression of a frameshift mutation using a mutant tRNA gene	93
4.5.4 Suppressing a nonsense codon using unaltered tRNAs	93
4.6 Suppression by post-translational modification	93
4.7 Extragenic suppression as a result of protein–protein interaction	94
4.7.1 Searching for suppressors that act by protein–protein interaction in eukaryotes	95
4.7.2 Extragenic suppression as a result of “lock-and-key” conformational suppression	100
4.8 Suppression without physical interaction	100
4.8.1 Bypass suppression	101
4.8.2 “Push me, pull you” bypass selection by counterbalancing of opposite activities	102
4.8.3 Extra-copy suppression as a form of bypass suppression	103
4.9 Suppression of dominant mutations	105
4.10 Designing your own screen for suppressor mutations	105
Summary and a warning	106
Box 4.1 Intragenic suppression of antimorphic mutations that produce a poisonous protein	87
Box 4.2 Bypass suppression of a telomere defect in the yeast <i>S. pombe</i>	102
Chapter 5 Determining when and where genes function	107
5.1 Epistasis: ordering gene function in pathways	107
5.1.1 Ordering gene function in a biosynthetic pathway	108
5.1.2 The use of epistasis in non-biosynthetic pathways: determining if two genes act in the same or different pathways	109

5.1.3	The real value of epistasis analysis is in the dissection of regulatory hierarchies	111
5.1.4	How might an epistasis experiment mislead you?	118
5.2	Mosaic analysis: where does a given gene act?	118
5.2.1	Tissue transplantation studies	119
5.2.2	Loss of the unstable ring X chromosome	120
5.2.3	Mitotic recombination	123
5.2.4	Genetically controllable mitotic recombination: the FLP-FRT system	124
	Summary	126
Chapter 6	Genetic fine-structure analysis	127
6.1	Intragenic mapping (then)	127
6.1.1	The first efforts towards finding structure <i>within</i> a gene	127
6.1.2	The unit of recombination and mutation is the base pair	129
6.2	Intragenic mapping (now)	134
6.3	Intragenic complementation meets intragenic recombination: the basis of fine-structure analysis	135
6.3.1	The formal analysis of intragenic complementation	136
6.4	An example of fine-structure analysis for a eukaryotic gene encoding a multifunctional protein	138
6.4.1	A genetic and functional dissection of the <i>HIS4</i> gene in yeast	138
6.5	Fine-structure analysis of genes with complex regulatory elements in eukaryotes	139
6.5.1	Genetic and functional dissection of the <i>cut</i> gene in <i>Drosophila</i>	139
6.6	Pairing-dependent intragenic complementation	142
6.6.1	Genetic and functional dissection of the <i>yellow</i> gene in <i>Drosophila</i>	142
6.6.2	The influence of the <i>zeste</i> gene on pairing-dependent complementation at the <i>white</i> locus in <i>Drosophila</i>	143
6.6.3	Genetic and functional dissection of BX-C in <i>Drosophila</i>	145
	Summary	146
Box 6.1	Genetic and functional dissection of the <i>rudimentary</i> gene in <i>Drosophila</i>	147–50
Chapter 7	Meiotic recombination	151
7.1	An introduction to meiosis	151
7.1.1	A cytological description of meiosis	158
7.1.2	A more detailed description of meiotic prophase	160
7.2	Crossingover and chiasmata: recombination involves the physical interchange of genetic material and ensures homolog separation	160
7.3	The classical analysis of recombination	162

7.4	Measuring the frequency of recombination	167
7.4.1	The curious relationship between the frequency of recombination and chiasma frequency (and why it matters)	167
7.4.2	Map lengths and recombination frequency	168
7.4.3	Determining the fraction of bivalents with zero, one, two, or more exchanges (tetrad analysis)	171
7.4.4	Statistical estimation of recombination frequencies (LOD scores)	182
7.4.5	The actual distribution of exchange events	192
7.4.6	Practicalities of mapping	193
7.5	The mechanism of recombination	193
7.5.1	Gene conversion	193
7.5.2	Previous models	195
7.5.3	The currently accepted mechanism of recombination: the DSBR model	198
	Summary	199
Box 7.1	The molecular biology of synapsis	155–6
Box 7.2	Do specific chromosomal sites mediate pairing?	156–7
Box 7.3	Crossingover in compound X chromosomes	163–4
Box 7.4	Does any sister chromatid exchange occur during meiosis?	166–7
Box 7.5	Using tetrad analysis to determine linkage	177
Box 7.6	Mapping centromeres in fungi with unordered tetrads	177
Chapter 8	Meiotic chromosome segregation	200
8.1	Types and consequences of failed segregation	201
8.2	The origin of spontaneous nondisjunction	202
8.3	The centromere	204
8.3.1	The isolation and analysis of the <i>S. cerevisiae</i> centromere	204
8.3.2	The isolation and analysis of the <i>Drosophila</i> centromere	207
8.4	Segregational mechanisms	213
8.4.1	How chiasmata ensure segregation	213
8.4.2	Achiasmate segregation	214
	Summary	218
Box 8.1	Identifying genes that encode centromere-binding proteins in yeast	206–7
Box 8.2	The concept of the epigenetic centromere in <i>Drosophila</i> and humans	212
Box 8.3	Achiasmate heterologous segregation in <i>Drosophila</i> females	217
	Epilogue	219
	References	220
	Partial author index	236
	Subject index	238
