

Full contents

List of boxes	xi
Preface	xii
Acknowledgments	xiv
1 The vocabulary of transcription	1
1.1 Introduction	1
1.2 The vocabulary of transcription	2
1.2.1 RNA biogenesis	2
1.2.2 The transcriptional machinery	4
1.2.3 Cis-elements	7
1.3 Evolutionarily conserved mechanisms of transcription	8
1.3.1 Conservation across the three domains of life	8
1.3.2 Model eukaryotic organisms (and a plug for genetics)	9
1.4 What's coming up	10
Problems	14
Further reading	14
2 RNA polymerases and the transcription cycle	16
2.1 Introduction	17
2.2 Core RNA polymerases	17
2.2.1 Bacterial core polymerases	19
2.2.2 Eukaryotic and archaeal core polymerases	19
2.3 Transcriptional elongation	23
2.3.1 Phosphoester linkage formation	23
2.3.2 Features of the ternary elongation complex	29
2.3.3 RNA polymerase as a motor	32
2.3.4 Elongation factors and backtracking	33
2.4 Transcriptional initiation	36
2.4.1 Distinct mechanisms for promoter recognition in bacteria and eukaryotes	36
2.4.2 Bacterial σ factors and promoter specificity	37
2.5 Transcriptional termination	42
2.5.1 Why terminate?	42
2.5.2 Termination in bacteria	42
2.5.3 Termination in eukaryotes	43

2.6	Summary	45
	Problems	46
	Further reading	47
3	The eukaryotic basal machinery	49
3.1	Introduction	50
3.2	The class II core promoter	50
3.3	The catalog of factors	52
3.4	Pathway to the preinitiation complex	52
3.5	Promoter recognition and nucleation of the PIC by TFIID	58
3.5.1	TATA box recognition by TBP	58
3.5.2	TBP-associated factors and their function in TFIID	59
3.6	TFIIB: a functional analog of bacterial σ factors	61
3.6.1	TFIIB as a bridge between the promoter and polymerase	61
3.6.2	BRF, a TFIIB paralog in the class III machinery, and promoter melting	62
3.6.3	Functional similarity between TFIIB family proteins and σ	64
3.7	TFIIH in promoter opening and promoter clearance	65
3.7.1	A unique DNA helicase requirement for class II promoter opening	65
3.7.2	A connection between DNA repair and transcription	66
3.7.3	TFIIH and RNA polymerase II phosphorylation	67
3.8	Summary	69
	Problems	69
	Further reading	70
4	Mechanisms of transcriptional activation	72
4.1	Introduction	73
4.2	Paradigms from <i>E. coli</i>	73
4.2.1	CRP: a sensor of the nutritional environment	73
4.2.2	λ cl: regulator of the lysis/lysogeny switch	75
4.2.3	Sequence-specific DNA recognition: the helix-turn-helix motif	76
4.2.4	Dimerization	77
4.2.5	Multiple targets for activators in the transcriptional machinery	77
4.2.6	How do activator-RNA polymerase contacts activate promoters?	78
4.3	Eukaryotic activators and their targets	86
4.3.1	The modular nature of eukaryotic activators	86
4.3.2	The Mediator: a special activator target in the eukaryotic transcriptional machinery	90
4.3.3	Release of Pol II from a paused state as a mechanism of activation	95
4.4	Summary	97
	Problems	98
	Further reading	99

5	Transcriptional control through the modification of chromatin structure	101
5.1	Introduction	102
5.2	Chromatin structure	103
5.2.1	The nucleosome	103
5.2.2	Higher order chromatin structure	104
5.2.3	Euchromatin and heterochromatin	105
5.3	Histone modification	107
5.3.1	Lysine acetylation: diverse roles in gene activation	109
5.3.2	Lysine methylation: a chemically stable histone mark	117
5.3.3	Cross talk between histone marks	118
5.4	ATP-dependent chromatin remodeling enzymes	119
5.4.1	A diverse family of chromatin remodeling complexes	119
5.4.2	ATP-fueled motors for increasing DNA accessibility	121
5.4.3	Targeting of chromatin remodeling complexes	124
5.5	Protein motifs that recognize modified histones	124
5.5.1	Chromodomains	125
5.5.2	Bromodomains	125
5.6	Coordination of activator–coactivator interactions	126
5.7	Summary	127
	Problems	129
	Further reading	130
6	Epigenetic control of transcription	133
6.1	Introduction	134
6.1.1	Common themes in epigenetics: a central role for histone methylation	137
6.2	Heterochromatic silencing	137
6.2.1	Chromosomal inheritance of the silent state	138
6.2.2	Histone methylation and maintenance of the silent state	142
6.2.3	Initiation of heterochromatic silencing	144
6.2.4	Evolutionary conservation of mechanisms for heterochromatic silencing	146
6.2.5	DNA methylation and heterochromatin	148
6.2.6	A distinct mechanism for heterochromatic silencing in budding yeast	149
6.3	Epigenetic control by Polycomb and Trithorax group proteins	150
6.3.1	Combinatorial control of segment identity	150
6.3.2	Establishment and maintenance phases of homeotic gene expression	152
6.3.3	Parallels between heterochromatic and PcG silencing	154
6.3.4	Maintenance of the active state by TrxG	155
6.3.5	A model for the epigenetic regulation of homeotic gene activity	158
6.4	X chromosome inactivation: parallels to heterochromatic and Polycomb group silencing	159

6.4.1	Random inactivation of the X chromosome	159
6.4.2	Cis-acting RNA in X inactivation	160
6.4.3	Histone modifications characteristic of both heterochromatic and PcG silencing on Xi	162
6.5	Summary	162
	Problems	164
	Further reading	164
7	Combinatorial control in development and signal transduction	167
7.1	Introduction	168
7.2	Synergy and antagonism	169
7.2.1	Integration of regulatory inputs by cis-regulatory modules	169
7.2.2	The "AND" and "NOT" operators	169
7.3	Synergy and the enhanceosome	172
7.3.1	Enhanceosome assembly and architectural factors	172
7.3.2	Cooperative recruitment of coactivators by enhanceosomes	174
7.3.3	Sequential coactivator recruitment	176
7.4	Antagonism and stripe formation	176
7.4.1	Developmental regulatory networks	178
7.4.2	Short-range repression and stripe formation	178
7.5	Antagonism and the signal-mediated switch	183
7.5.1	Nuclear receptors: antagonism between coregulators	185
7.5.2	Receptor tyrosine kinase pathways: competition for a common DNA element	188
7.6	Summary	189
	Problems	192
	Further reading	192
	Answers to problems	194
	Glossary	199
	Index	220

Color plate section between pp. 82 and 83
