

# Contents

## Preface, xviii

### 1 The beginnings of molecular biology, 1

#### 1.1 Introduction

#### 1.2 Historical perspective

Insights into heredity from round and wrinkled peas: Mendelian genetics

Insights into the nature of hereditary material: the transforming principle is DNA

Creativity in approach leads to the one gene–one enzyme hypothesis

The importance of technological advances: the Hershey–Chase experiment

A model for the structure of DNA: the DNA double helix

#### Chapter summary

#### Analytical questions

#### Suggestions for further reading

### 2 The structure of DNA, 13

#### 2.1 Introduction

#### 2.2 Primary structure: the components of nucleic acids

Five-carbon sugars

Nitrogenous bases

The phosphate functional group

Nucleosides and nucleotides

#### 2.3 Significance of 5' and 3'

#### 2.4 Nomenclature of nucleotides

#### 2.5 The length of RNA and DNA

#### 2.6 Secondary structure of DNA

Hydrogen bonds form between the bases

Base stacking provides chemical stability to the DNA double helix

Structure of the Watson–Crick DNA double helix

Distinguishing between features of alternative double-helical structures

DNA can undergo reversible strand separation

#### 2.7 Unusual DNA secondary structures

Slipped structures

Cruciform structures

Triple helix DNA

Disease box 2.1 Friedreich's ataxia and triple helix DNA

#### 2.8 Tertiary structure of DNA

Supercoiling of DNA

Topoisomerases relax supercoiled DNA

What is the significance of supercoiling *in vivo*?

Disease box 2.2 Topoisomerase-targeted anticancer drugs

#### Chapter summary

#### Analytical questions

#### Suggestions for further reading

### 3 Genome organization: from nucleotides to chromatin, 37

#### 3.1 Introduction

#### 3.2 Eukaryotic genome
