Preface	xiii
Contributors	xvi
1 Plant proteomics: challenges and resources	1
JOSHUA L. HEAZLEWOOD and A. HARVEY MILLAR	
1.1 Introduction	1
1.2 Challenges	2
1.2.1 Sample extraction	2
1.2.1.1 Two-dimensional gel electrophoresis	3
1.2.1.2 Direct MS analysis of samples	4
1.2.2 Sample preparation and arraying	4
1.2.2.1 Two-dimensional gel electrophoresis	5
1.2.2.2 One-dimensional gel electrophoresis	7
1.2.2.3 Blue-native gel electrophoresis	7
1.2.2.4 Direct analysis of samples by MS	7
1.2.3 Mass spectrometry (MALDI and ESI)	9
1.2.3.1 MALDI	9
1.2.3.2 ESI	12
1.2.4 Analysis depth	13
1.2.5 Data analysis	14
1.2.5.1 Peptide mass fingerprints	15
1.2.5.2 Peptide fragmentation data (MS/MS)	16
1.2.5.3 Analysis options	16
1.2.6 Quantitation	17
1.2.6.1 Gel stains	18
1.2.6.2 Chemical labelling of sample	19
1.2.7 Modifications	20
1.2.8 Data	21
1.3 Resources	22
1.3.1 Proteomic databases	22
1.3.2 Online proteomic tools and resources	24
1.4 Future	24
2 Proteomic analysis of post-translational modifications by mass spectrometry	33
ALBRECHT GRUHLER and OLE N. JENSEN	
2.1 Summary	33
2.2 Introduction	33

2.3	Considerations for the experimental design of PTM analysis by proteomics	35
2.4	Analysis of PTMs by proteomic approaches	38
2.4.1	Phosphorylation	38
2.4.2	Protein glycosylation	43
2.4.3	GPI-AP	46
2.4.4	Farnesylation	47
2.4.5	N-terminally modified proteins	48
2.5	Conclusions and perspectives	49
3	Strategies for the investigation of protein–protein interactions in plants	55
	HANS-PETER BRAUN and UDO K. SCHMITZ	
3.1	Summary	55
3.2	Introduction	55
3.3	Biochemical procedures to characterize protein–protein interactions	56
3.3.1	Chromatographic purifications	56
3.3.2	Sucrose gradient ultrafiltration	56
3.3.3	Native gel electrophoresis	56
3.3.4	Immunoprecipitations	58
3.4	Genetic procedures to characterize protein–protein interactions	58
3.4.1	Yeast two-hybrid system	59
3.4.2	Yeast three-hybrid system	60
3.4.3	Yeast one-hybrid system	61
3.4.4	Limitations of yeast two-hybrid systems	61
3.4.5	Split-ubiquitin system	62
3.4.6	Bimolecular fluorescence complementation (BiFC)	62
3.4.7	Förster resonance energy transfer (FRET)	63
3.4.8	Tagging technologies for the purification of protein complexes	64
3.5	Cytological procedures to characterize protein–protein interactions	64
3.6	Outlook	65
4	Proteomics of disulphide and cysteine oxidoreduction	71
	KENJI MAEDA, PER HÄGGLUND, CHRISTINE FINNIE and BIRTE SVENSSON	
4.1	Introduction	71
4.2	Control of cellular redox status	72
4.2.1	Sequence and structural features of proteins catalysing cysteine redox modifications	73
4.2.2	Catalytic mechanisms of Trxs and Grxs	74
4.3	Proteomics techniques for analysis of cysteine modifications	75
4.3.1	Reagents for cysteine labelling	75
4.3.2	Disulphide mapping	79
4.3.3	S-glutathionylation	81
4.3.4	Cysteine SOH, SO ₂ H and SO ₃ H	82
4.3.5	Trxs and disulphide reduction	83
4.3.6	S-nitrosylation	88
4.4	Conclusions and perspectives	89

5	Structural proteomics	99
	RUSSELL L. WROBEL, CRAIG A. BINGMAN, WON BAE JEON, JIKUI SONG, DMITRIY A. VINAROV, RONNIE O. FREDERICK, DAVID J. ACETI, HASSAN K. SREENATH, ZSOLT ZOLNAI, FRANK C. VOJTIK, EDUARD BITTO, BRIAN G. FOX, GEORGE N. PHILLIPS Jr and JOHN L. MARKLEY	
5.1	Introduction	99
5.2	Project data handling: Sesame	101
5.3	ORF cloning	102
5.4	<i>E. coli</i> cell-based protein production pipeline	104
5.4.1	Large-scale protein production and labeling	106
5.4.2	Protein purification	107
5.5	Wheat germ cell-free protein production	109
5.6	Mass spectrometry of purified proteins for quality assurance and analysis	110
5.7	Crystallomics and X-ray structure determination	112
5.7.1	Initial screening	112
5.7.2	Optimizations and salvage	113
5.7.3	Future directions	115
5.8	NMR screening and structure determination	115
5.8.1	Sample screening	115
5.8.2	NMR data collection	116
5.8.3	Chemical shift assignment and structural calculation	117
5.8.4	Structure-based functional annotation	117
5.9	Illustrative structures and functional implications	118
6	Cereal proteomics	129
	SETSUKE KOMATSU	
6.1	Introduction	129
6.2	Comprehensive analysis and cataloguing of cereal proteins	130
6.2.1	Cataloguing of rice proteins using 2D-PAGE	130
6.2.2	The rice proteomics project	130
6.2.2.1	Proteomics analysis of rice tissues	131
6.2.2.2	Proteomics analysis of subcellular compartments	133
6.3	Functional analysis of cereal using differential proteomics	135
6.3.1	Stresses	135
6.3.1.1	Cold	135
6.3.1.2	Drought	136
6.3.1.3	Salinity	136
6.3.1.4	Ozone	138
6.3.1.5	Fungus	138
6.3.1.6	Virus	139
6.3.2	Hormones	140
6.3.2.1	Gibberellin	140
6.3.2.2	Brassinosteroid	142
6.3.2.3	JA	142
6.3.2.4	Auxin	142
6.4	Future prospects of cereal proteomics	143

7	Proteome analysis for the study of developmental processes in plants	151
	LOÏC RAJJOU, KARINE GALLARDO, CLAUDETTE JOB and DOMINIQUE JOB	
7.1	Introduction	151
7.2	Examples of proteome analyses of plant development	153
7.2.1	Seed development and germination	153
7.2.1.1	Proteomics of developing seeds	153
7.2.1.2	Proteomics of somatic embryogenesis	156
7.2.1.3	Proteomes of mature seeds and their evolution during germination	158
7.2.1.4	Proteomics unravels metabolic control of seed development and germination	162
7.2.1.5	The neosynthesized proteome during germination	165
7.2.1.6	Proteomics of the thioredoxin protein-protein interaction in developing and germinating seeds	167
7.2.1.7	The oxidized (carbonylated) proteome in developing and germinating seeds	169
7.2.1.8	Proteomics of developmental mutants in seeds	171
7.2.1.9	Proteomics of genetic diversity for seed composition	172
7.2.1.10	A model of seed development and germination based upon proteomics data	174
7.2.2	Proteomics of other developmental processes in plants	175
7.3	Conclusions and perspectives	177
8	Surveying the plant cell wall proteome, or secretome	185
	TAL ISAACSON and JOCELYN K.C. ROSE	
8.1	Introduction	185
8.2	The multifunctional cell wall	186
8.2.1	Structural proteins	186
8.2.2	Wall modifying proteins	186
8.2.3	Defense-associated wall proteins	187
8.2.4	Secreted peptides and developmental regulation	187
8.2.5	Extracellular proteins and abiotic stresses	187
8.2.6	Wall proteins and metabolism	188
8.3	Technical and conceptual challenges in defining the cell wall proteome, or secretome	188
8.4	Approaches for plant cell wall protein extraction and identification	189
8.4.1	Non-disruptive isolation of extracellular proteins	189
8.4.2	Disruptive isolation of wall-bound proteins	193
8.5	Computational prediction of the plant secretome	194
8.6	Functional screens for extracellular proteins	197
8.7	Contamination and validation of the cell wall proteome	198
8.8	Conclusions	202

9 Proteomics of plant mitochondria	211
NATALIA V. BYKOVA and IAN M. MØLLER	
9.1 Mitochondria as attractive targets for subcellular proteomics	211
9.2 Methods and approaches briefly for identification of proteins	212
9.2.1 Gel electrophoresis and immunoblotting	212
9.2.2 Blue-native PAGE and membrane proteomics	212
9.2.3 One- and two-dimensional LC/MS/MS	213
9.2.4 Prediction of mitochondrially imported proteins from genomic information	213
9.3 Mitochondrial proteins identified	214
9.3.1 Total proteins	214
9.3.2 Membrane proteins and supercomplexes	216
9.3.3 Proteins with counterparts in other organisms and plant-specific proteins	219
9.3.4 Intracellular communication	220
9.3.5 Mitochondria from different species, tissues and organs	224
9.4 Stress-responsive proteins and redox regulation	225
9.4.1 Impact of environmental stress	225
9.4.2 Oxidative stress and anoxia	228
9.4.3 Metal-binding proteins	231
9.4.4 Proteins associated with PCD	231
9.4.5 Thioredoxins and their target proteins	232
9.5 Protein phosphorylation and signal transduction	233
9.5.1 Phosphoproteins	233
9.5.2 Kinases and phosphatases	234
9.6 Concluding remarks	237
Index	245
