Preface	xi
1 Introduction: why learn modeling?	1
1.1 Introduction	1
1.2 Structure of the book	5
1.3 Supporting computer software	7
Recommended supporting reading	8
Supporting file on the CD	9
2 A starting problem: conservation of the dodo	10
2.1 Introduction	10
2.2 Conservation of the dodo	10
3 Descriptive models: choosing an equation	15
3.1 Introduction	15
3.2 Dynamic equations	17
3.3 Geometric and exponential growth	19
3.4 Adding a population ceiling	22
3.5 Basic density-dependent models	24
3.6 Curvilinear density dependence	30
3.7 Delayed density dependence	35
3.8 Depensation or Allee effect	36
3.9 Incorporating environmental variability	37
3.10 Overview	40
Recommended supporting reading	41
Programs on the accompanying CD	43
Exercises	43
4 Structured population models: age, size, or stage	44
4.1 Introduction	44
4.2 Age-structured models	46

4.3	Stage-structured models	53
4.4	Projection versus prediction	56
4.5	Overview	56
	Recommended supporting reading	57
	Programs on the accompanying CD	57
	Exercises	57
5	Consumer–resource models: population interactions	59
5.1	Introduction	59
5.2	Coupling population equations	60
5.3	Simple interactive model	61
5.4	Incorporating competitive interference	68
5.5	Ratio-dependent intake response and time frames	70
5.6	Accommodating environmental variability	70
5.7	Overview	73
	Recommended supporting reading	73
	Programs on the accompanying CD	74
	Exercises	74
6	Simulation models: assessing understanding	75
6.1	Introduction	75
6.2	Adding density dependence to an age-structured model	77
6.3	A specific example: the kudu model	83
6.4	Simplification for management	96
6.5	Generalizing the model for other species	98
6.6	Overview	98
	Recommended supporting reading	99
	Programs on the accompanying CD	99
	Exercises	99
7	Harvesting models: adaptive management	101
7.1	Introduction	101
7.2	Principles of “maximum sustained yield”	103
7.3	Surplus production model accommodating environmental variability	106
7.4	Stock-recruitment model	109
7.5	Policies for setting the harvest quota	112
7.6	Adaptive management responses	113
7.7	Stock-recruitment models for fish populations	114
7.8	Overview	119
	Recommended supporting reading	120
	Programs on the accompanying CD	120
	Exercises	120

8	Population viability models: risk analysis	122
8.1	Introduction	122
8.2	Demographic stochasticity	124
8.3	Environmental variability and catastrophes	125
8.4	Genetic stochasticity	126
8.5	Population viability models	126
8.6	Overview	135
	Recommended supporting reading	136
	Programs on the accompanying CD	137
	Exercises	137
9	Metapopulation models: spreading the risk	138
9.1	Introduction	138
9.2	Basic patch incidence model	140
9.3	Correlated migration and extinction	142
9.4	Variable patch size and spacing	143
9.5	Source and sink populations	145
9.6	Mainland–island habitats	145
9.7	Examples of vertebrate metapopulations	146
9.8	Overview	147
	Recommended supporting reading	147
	Exercises	147
10	Modeling infectious diseases: outbreak dynamics	148
10.1	Introduction	148
10.2	Basic infection model	149
10.3	Cyclic outbreak dynamics: measles	151
10.4	Slowly spreading sexually transmitted disease: HIV–AIDS	155
10.5	Controlling the spread of wildlife diseases	159
10.6	Overview	162
	Recommended supporting reading	162
	Exercises	163
11	Scenario models: exploring options	164
11.1	Introduction	164
11.2	Background situation	166
11.3	Theoretical concepts	167
11.4	Modeling the white rhino–grassland system	169
11.5	Exploring management options	178
11.6	Overview	180
	Recommended supporting reading	181
	Program on the accompanying CD	181
	Exercises	181

12 Vegetation models: biomass to gap dynamics	182
12.1 Introduction	182
12.2 Seasonal biomass dynamics of vegetation supporting herbivores	183
12.3 Size-structured dynamics of a tree population	188
12.4 Gap dynamics model	194
12.5 Overview	198
Recommended supporting reading	199
Programs on the accompanying CD	199
Exercises	199
13 State transition models: habitat patch dynamics	200
13.1 Introduction	200
13.2 Vegetation successional dynamics	202
13.3 Managing savanna vegetation for livestock	206
13.4 Spatially explicit grid model	210
13.5 Overview	212
Recommended supporting reading	212
Programs on the accompanying CD	213
Exercises	213
14 Habitat suitability models: adaptive behavior	214
14.1 Introduction	214
14.2 Shifting habitat use by overwintering geese	216
14.3 Habitat suitability for a browsing antelope from vegetation composition	220
14.4 General principles	225
14.5 Overview	226
Recommended supporting reading	227
Programs on the accompanying CD	227
Exercises	227
15 Reconciling models with data: statistical diagnosis	228
15.1 Introduction	228
15.2 Model selection statistics	230
15.3 Diagnosing the causes of antelope population declines	231
15.4 Overview	246
Recommended supporting reading	247
Programs on the accompanying CD	247
Exercise	247

Appendices	248
Appendix 2.1: Guidelines for the dodo population model	248
Appendix 2.2: Assumptions that you might have made	249
Appendix 2.3: Overview of what you should have learned	250
Appendix 3.1: Exponential growth model formulated in a spreadsheet	251
Appendix 3.2: Converting the geometric growth model into a ceiling model	253
Appendix 3.3: Formulating the logistic model in a spreadsheet	253
Appendix 3.4: Guidelines for developing a spreadsheet model for a set of descriptive equations	254
Appendix 4.1: Formulating an elementary age-structured population model in a spreadsheet	255
Appendix 4.2: Formulating a stage-structured model for a sea turtle population in a spreadsheet	257
Appendix 5.1: A simple interactive model for a herbivore-vegetation system	259
Appendix 5.2: Incorporating a saturating functional response	260
Appendix 5.3: Introducing competitive interference	262
Appendix 5.4: Allowing for environmental variability	262
Appendix 5.5: Modeling the optimal stocking level for a livestock ranch	263
Appendix 6.1: Formulating an age-structured population model incorporating density dependence	265
Appendix 6.2: Incorporating environmental variability into the age-structured model	268
Appendix 7.1: Harvesting model based on the logistic equation in a constant environment	269
Appendix 7.2: Harvesting model for a goose population accommodating environmental variability	270
Appendix 7.3: Simple dynamic pool model for fish harvesting	272
Appendix 7.4: Dynamic pool model for a long-lived fish with several recruitment stages	276
Appendix 8.1: Demographic stochasticity in a spreadsheet	277
Appendix 9.1: Basic spreadsheet model for metapopulation dynamics	279
Appendix 9.2: Model representing correlated migration and extinction	282
Appendix 9.3: Model representing variable patch size and spacing	283
Appendix 9.4: Model representing source and sink populations	284

Appendix 10.1: Modeling the outbreak dynamics of a transient infection: measles	285
Appendix 10.2: Modeling the dynamics of a sexually transmitted disease: HIV-AIDS	287
Appendix 11.1: Modeling the white rhino-grassland interaction in a spreadsheet	289
Appendix 12.1: Formulating a model of the seasonal biomass dynamics of a grass forage resource under grazing	294
Appendix 12.2: Spreadsheet model for harvesting a tropical hardwood forest	298
Appendix 13.1: Formulating a Markovian transition model for vegetation succession	301
Appendix 13.2: Savanna management model	303
Appendix 14.1: Habitat occupation model for overwintering geese	308
