<i>Preface</i>	vii
<i>Acknowledgements</i>	ix
<i>Companion website and CD-ROM</i>	x
1 Introduction: the role of science in conservation	1
Part I Basic concepts in scientific investigations for conservation	7
2 Using models in conservation biology	9
3 Models of population dynamics	15
4 Applying population models to conservation	32
5 Basics of study design and analysis	47
Part II Conservation studies and monitoring programs	71
6 General principles of estimation	73
7 Occupancy (presence-absence) analysis	81
8 Sample counts for abundance estimation	101
9 Distance sampling for estimating density and abundance	115
10 Capture-mark-recapture studies for estimating abundance and density	135
11 Estimation of survival from radiotelemetry, nesting success studies, and age distributions	160
12 Mark-recapture for estimating survival, recruitment, abundance, and movement rates	189
13 Analysis of habitat	219
14 Estimation of species richness and other community parameters	230
Part III Integrating modeling and monitoring for conservation	251
15 Elements of conservation decision making	253
16 Accounting for uncertainty in conservation decisions	265
17 Learning and adaptive management	274
18 Case study: decision modeling and adaptive management for declining grassland birds in the southeastern USA	289
19 Summary and recommendations	303

<i>Literature cited</i>	307
<i>Glossary</i>	314
<i>Appendix A: Statistical and modeling programs available on the worldwide web</i>	324
<i>Appendix B: Other internet resources</i>	326
<i>Appendix C: Modeling and statistical notation</i>	328
<i>Appendix D: Key to abundance and parameter estimation</i>	331
<i>Index</i>	337
