I	Introduction	1
1	Ecological patterns in time and space	3
1.1	Local structures	3
1.2	Spatial and spatiotemporal structures	6
2	An overview of modeling approaches	11
II	Models of temporal dynamics	19
3	Classical one population models	21
3.1	Isolated populations models	21
3.1.1	Scaling	25
3.2	Migration models	27
3.2.1	Harvesting	30
3.3	Glance at discrete models	44
3.4	Peek into chaos	46
4	Interacting populations	49
4.1	Two-species prey–predator population model	50
4.2	Classical Lotka–Volterra model	57
4.2.1	More on prey–predator models	58
4.2.2	Scaling	59
4.3	Other types of population communities	60
4.3.1	Competing populations	60
4.3.2	Symbiotic populations	62
4.3.3	Leslie–Gower model	64
4.3.4	Classical Holling–Tanner model	65
4.3.5	Other growth models	66
4.3.6	Models with prey switching	66
4.4	Global stability	68
4.4.1	General quadratic prey–predator system	71
4.4.2	Mathematical tools for analyzing limit cycles	72
4.4.3	Routh–Hurwitz conditions	74
4.4.4	Criterion for Hopf bifurcation	75
4.4.5	Instructive example	76
4.4.6	Poincaré map	77

4.5	Food web	80
4.6	More about chaos	87
4.7	Age-dependent populations	91
4.7.1	Prey-predator, age-dependent populations	95
4.7.2	More about age-dependent populations	96
4.7.3	Simulations and brief discussion	108
5	Case study: biological pest control in vineyards	111
5.1	First model	112
5.1.1	Modeling the human activity	114
5.2	More sophisticated model	116
5.2.1	Models comparison	122
5.3	Modeling the ballooning effect	124
5.3.1	Spraying effects and human intervention	134
5.3.2	Ecological discussion	134
6	Epidemic models	137
6.1	Basic epidemic models	137
6.1.1	Simplest models	139
6.1.2	Standard incidence	141
6.2	Other classical epidemic models	145
6.3	Age- and stage-dependent epidemic system	147
6.4	Case study: Aujeszky disease	151
6.5	Analysis of a disease with two states	156
7	Ecoepidemic systems	165
7.1	Prey-diseased-predator interactions	165
7.1.1	Some biological considerations	176
7.2	Predator-diseased-prey interactions	178
7.3	Diseased competing species models	184
7.3.1	Simulation discussion	189
7.4	Ecoepidemics models of symbiotic communities	191
7.4.1	Disease effects on the symbiotic system	194
7.4.2	Disease control by use of a symbiotic species	195
III	Spatiotemporal dynamics and pattern formation: deterministic approach	197
8	Spatial aspect: diffusion as a paradigm	199
9	Instabilities and dissipative structures	205
9.1	Turing patterns	206
9.1.1	Turing patterns in a multispecies system	218
9.2	Differential flow instability	223
9.3	Ecological example: semiarid vegetation patterns	231

9.3.1	Pattern formation due to nonlocal interactions	236
9.4	Concluding remarks	245
10	Patterns in the wake of invasion	247
10.1	Invasion in a prey-predator system	248
10.2	Dynamical stabilization of an unstable equilibrium	260
10.2.1	A bifurcation approach	261
10.2.2	Comparison of wave speeds	266
10.3	Patterns in a competing species community	269
10.4	Concluding remarks	277
11	Biological turbulence	281
11.1	Self-organized patchiness and the wave of chaos	283
11.1.1	Stability diagram and the hierarchy of regimes	290
11.1.2	Patchiness in a two-dimensional case	294
11.2	Spatial structure and spatial correlations	296
11.2.1	Intrinsic lengths and scaling	300
11.3	Ecological implications	308
11.3.1	Plankton patchiness on a biological scale	308
11.3.2	Self-organized patchiness, desynchronization, and the paradox of enrichment	312
11.4	Concluding remarks	321
12	Patchy invasion	325
12.1	Allee effect, biological control, and one-dimensional patterns of species invasion	326
12.1.1	Patterns of species spread	331
12.2	Invasion and control in the two-dimensional case	338
12.2.1	Properties of the patchy invasion	344
12.3	Biological control through infectious diseases	350
12.3.1	Patchy spread in SIR model	353
12.4	Concluding remarks	358
IV	Spatiotemporal patterns and noise	363
13	Generic model of stochastic population dynamics	365
14	Noise-induced pattern transitions	369
14.1	Transitions in a patchy environment	369
14.1.1	No noise	370
14.1.2	Noise-induced pattern transition	370
14.2	Transitions in a uniform environment	372
14.2.1	Standing waves driven by noise	373

15 Epidemic spread in a stochastic environment	375
15.1 Model	376
15.2 Strange periodic attractors in the lytic regime	379
15.3 Local dynamics in the lysogenic regime	382
15.4 Deterministic and stochastic spatial dynamics	383
15.5 Local dynamics with deterministic switch from lysogeny to lysis	385
15.6 Spatiotemporal dynamics with switches from lysogeny to lysis	390
15.6.1 Deterministic switching from lysogeny to lysis	391
15.6.2 Stochastic switching	393
16 Noise-induced pattern formation	397
