## *Preface*

(vii)

### **1. Introduction**

1

- Molecular Cloning • Cellular Cloning • Cloning in Stem Cell Research • Artificial Cloning of Organisms • Human Cloning • Possible Abnormalities Due to Cloning

### **2. Mammalian Cloning**

16

- Nuclear Transfer and Stem Cells • Reprogramming Differentiated Cells • Transgenic Cloned Goats • Materials and Methods • Nuclear Transfer • Results • Embryo Development and Cloned Transgenic Offspring • Prepubertal Propagation of Transgenic Cloned Goats • Prepubertal Propagation of Cloned Goats • Cloning of Domesticated Mammals

### **3. Partial Cloning**

66

- Method • Plant Stem Cells • Stem Cell Marker • Stem Cell Network • Boyd Melson, Boxer who Donates all His Earnings to Stem Cell Research • Cell Bank

### **4. The Cloning Process**

79

- Genetics • Features of Inheritance • Molecular Basis for Inheritance • Gene Expression • Genetic Change • Genetic Disorders • Single Gene Disorder • Background: Diploid, Chromosomes, Genes, Loci, & Alleles • Classification by Fitness or Trait Value • Dominant and Recessive Genetic Diseases in Humans • Huntington's Disease Clinical Research

### **5. Stem Cell Research and Cloning**

117

- Embryonic Stem Cells • Status of the Human Embryo • The Embryo and its Placenta • Respecting the Embryo • Public Policy • How Scientists Clone Cells • Producing Clones: Animal Kingdom

### **6. Genetic Mechanisms**

154

- Slipped Strand Mispairing can Cause VNTR Polymorphism at Short Tandem Repeats (Microsatellites) • Pathogenic Mutations

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| • The Pathogenic Potential of Repeated Sequences • Interspersed Repeats often Predispose to Large Deletions and Duplications • DNA Repair • Physical and Transcript Mapping                                                                                                                                                                                                                                                                                                                                                                                                                     |            |
| <b>7. Genetic Engineering</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>190</b> |
