Preface

vii

1. Introduction 1-27

Introduction, Oparin's hypothesis, Miller's Experiments, Genetic Material, Griffith's effect, Bacterial Recombination, DNA- Replication, Watson-Crick Model of DNA, Forms of DNA, Z DNA (left banded DNA), Double Helical Structure of DNA, Chargaff's Rule, *E.Coli* : The Early Workhorse, Nucleus, Chromosomes, Replication of DNA, Nucleic Acids, Structure of DNA, DNA as Genetic Material, RNA, Type of RNA, Function of RNA, Gene, Genetic Code, Features of Genetic Code, Wobble Hypothesis, Concepts of Gene

Section - 1: GENERAL PRINCIPLES AND TECHNIQUES

2. Microscopy 29-47

Introduction, Invention of First Microscope, Modern Microscopic Techniques, Light Microscopy, Construction and Working of a Compound Microscope, Compound (Bright Field) Microscope, Dark Field Microscopy, Phase Contrast Microscopy, Fluorescence Microscopy, Electron Microscopy, Transmission Electron Microscopy or TEM, Scanning Electron Microscope, Limitations of Electron Microscopy, Ultraviolet Microscopy

3. Aqueous Solutions 49-56

Introduction, Water, Acids, Bases and Buffers, Zwitterionic Compounds, Physiological Solutions

4. Spectroscopy 57-66

Introduction, Electromagnetic Spectroscopy, Absorption Spectroscopy, Beer-Lambert Law, Atomic Spectroscopy, Electron Spectroscopy, Laser Spectroscopy, Molecular Spectroscopy, Ultraviolet and Visible Absorption Spectroscopy, Nuclear and Magnetic Spectroscopy, X-Ray & Gamma Ray Spectroscopy, Mass Spectroscopy

5. Centrifugation 67-73

Introduction, Theory of Centrifugation, Types of Centrifugation, Density Gradient Centrifugation, Types of Centrifuges

6. Chromatography 75-90

Introduction, Principles, Distribution of Analyte Phases, Equipment and Basic Operation, Chromatogram, Adsorption Chromatography, Partition Chromatography, Paper Chromatography, Hydrophobic Interaction Chromatography, Ion Chromatography, Affinity Chromatography, Gas Chromatography, HPLC

7. Electrophoresis	91-100
Introduction, Types of Electrophoresis, Agar/Agarose Gel Electrophoresis, Gradient Gel Electrophoresis, Capillary Electrophoresis (CE), DNA Fingerprinting, Human Genome Project	
8. Radioisotopic Techniques	101-112
Introduction, Radioisotopes and Radioactivity, Types of Radioactivity, Isotopic Labeling, Detection and Measurement Radioactivity, Scintillation Counting	

Section - 2: ENZYME AND PROTEINS

9. Protein Purification	113-121
Introduction, Protein Mixtures, General Features, Electrophoresis, Protein Quantitation Assays, Protein Purification, Criteria for Purity, Purified Proteins, Importance of Protein Purification	
10. Structure of Proteins	123-126
Introduction, Crystallization, NMR Spectroscopy, X-ray Diffraction	
11. Peptide Sequencing	127-134
Introduction, Separation, Purification and Characterization of Peptide Chains, Mass Spectrometers, Recording of Sample Ions, Electrospray, Specific Cleavage Reaction	
12. Mapping and Synthesis	135-143
Introduction, Epitopes Mapping, Principle of Display Technique, Epitope Mapping Technology, Solid Supports, Protection, Chain Elongation, Cleavage	
13. Enzyme Kinetics	145-176
Introduction, Characteristic of Enzymes, Enzyme Specificity, Classification of Enzymes, The Kinetics of Enzyme Reaction, Influence of Substrate Concentration, Inhibitors, The Proteolytic Enzymes, The Endopeptidases, The Oxidative Enzymes, Splitting, Transferring and Isomerizing Enzymes, Enzymatic Abnormalities, Immobilized Enzymes	
14. Immobilized Enzymes	177-182
Introduction, Preparation Techniques, Adsorption, Occlusion, Cross-linking, Covalent Binding, Immobilization Method, Enzyme Reactor, Kinetic Properties	

Section - 3: IMMUNOLOGICAL ANALYSIS

15. Antigen and Antibody Techniques	183-199
Introduction, Measurement of Antibody Affinity, Types of Antigen-Antibody Reactions, Precipitation Reactions, Monoclonal Antibodies, Purifying Antibodies, Monoclonal Therapy	

Section - 4: DNA TECHNIQUES

16. Nucleic Acid	201-212
Introduction, Biological Importance, Nucleoproteins, Pyrimidine Bases, Purine Bases, Nucleotides, Biological Function of Nucleic Acids	

17. DNA	213-225
Introduction, Phosphoric Acid, Pentose Sugar, Nitrogenous Bases, DNA, Chargaff's Base Ratio, Double Helical Structure of DNA, Z-DNA and B-DNA, Heteroduplex DNA, Ribonucleic Acid	
18. RNA	227-237
Introduction, Ribosomal RNA, Messenger RNA, Transfer RNA, Three-dimensional Structure, DNA Replication, Stahl's Experiment, Untwisting Proteins, RNA Directed DNA Synthesis, Eukaryotic DNA Polymerase, Genetic Material	
19. DNA Modifying Enzymes	239-268
Introduction, Genomic DNA, Getting DNA, DNA Isolation, Purification of DNA, Precipitation of DNA, DNA Analysis, RNA Purity, Restriction Enzymes, DNA Fractionation, Bacteriophage, Cosmids	
20. Immunochemical Assays	269-283
Introduction, Radioimmunoassay, Enzyme Linked Antibody Capture, ELISpot A, Fluorescent Antibody, Western Immunoblotting, Electrophoresis of Protein, Transblotting Protein, Immunoprecipitation, Immunofluorescence, Fluorescence Activated Cell, Immunoelectron Microscopy, Immunohistochemistry, Complement System	
21. Immunology	285-307
Introduction, Type of Immunity, Characters of Antigen, Immunoglobulin, Immune System, Cells of Immune System, Properties of Immunoglobulin, Migration Inhibitory Factor (MIF), Immune Electrophoresis, Manipulation of Immune System, The Arthus Reaction	
22. PCR Techniques	309-320
Introduction, Template DNA, Design of PCR, Thermostable DNA, Template Denaturation, Annealing Temperature, Modifications of PCR, RAPD, Application of PCR	

Section - 5: CELL TECHNOLOGY

23. Eukaryotic Cells	321-334
Introduction, Laboratory Design, Microbiological Safety Cabinets, Safety Aspects of Cell Culture, General Handling Techniques, Cell Culture, Cell Environment, Prokaryotic Cell	
24. Fermentation Process	335-345
Introduction, Artificial Fermentation, Design of Industrial Fermentation, Cellular Catalysts, Bioreactors, Modes of Bioreactor Operation, Fermentation Kinetics, Downstream Processing of Fermented Products	

Section - 6: GENETIC ENGINEERING

25. Genetic Engineering	347-352
Introduction, Isolation of DNA, Gene Theory, Recombinant DNA	

26. Tools of Genetic Engineering	353-370
Introduction, Morgan Experiment, Restriction Enzymes, Endonucleases, Isolation of DNA, Cloning Vectors	
27. Techniques of Genetic Engineering	371-401
Introduction, Cloning, Gene Cloning, Dolly, Hybridization, Immunological Detection, Radioactive Labeling, DNA Sequencing, Model for PEG Action, DNA Delivery, Microinjection	
28. Genetic Engineering for Human Health	403-427
Introduction, HIV/AIDS, Hepatitis, Leprosy, Polio, Diabetes, Mental Health, Malnutrition, Recombinant DNA, Gene Therapy, Genetic Counselling, Gene Synthesis, Human Genetics, Sex-Differentiation, Sex-Linked Inheritance	
Glossary	429-452
Index	453-458
