|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <i>Preface</i> . . . . .                                                                                                                                                                                                                                                                              | v   |
| <i>Contributors</i> . . . . .                                                                                                                                                                                                                                                                         | ix  |
| 1. Using Fluorescent Proteins to Study Poxvirus Morphogenesis . . . . .<br><i>Brian M. Ward</i>                                                                                                                                                                                                       | 1   |
| 2. Molecular Imaging of Human Embryonic Stem Cells . . . . .<br><i>Kazim H. Narsinh, Feng Cao, and Joseph C. Wu</i>                                                                                                                                                                                   | 13  |
| 3. Use of a GFP-PML-Expressing Cell Line as a Biosensor<br>for Human Cytomegalovirus Infection . . . . .<br><i>Tomonori Ueno and Kiyoko Ogawa-Goto</i>                                                                                                                                                | 33  |
| 4. Dual-Color Imaging of Tumor Angiogenesis . . . . .<br><i>Robert M. Hoffman</i>                                                                                                                                                                                                                     | 45  |
| 5. Use of GFP to Analyze Morphology, Connectivity,<br>and Function of Cells in the Central Nervous System. . . . .<br><i>Alan R. Harvey, Erich Ehlert, Joris de Wit, Eleanor S. Drummond,<br/>Margaret A. Pollett, Marc Ruitenberg, Giles W. Plant, Joost Verbaagen,<br/>and Christiaan N. Levelt</i> | 63  |
| 6. Expression of EGFP by Adenovirus-Mediated Gene Transfer<br>in the Central Nervous System . . . . .<br><i>Ryohhei Tomioka</i>                                                                                                                                                                       | 97  |
| 7. Adenovirus-Mediated Delivery of Short Hairpin RNA (shRNA)<br>Mediates Efficient Gene Silencing in Terminally<br>Differentiated Cardiac Myocytes . . . . .<br><i>Andreas Rinne, Christoph Littwitz, Kirsten Bender,<br/>Marie-Cécile Kienitz, and Lutz Pott</i>                                     | 107 |
| 8. Microscopic Analysis of Adenoviral Decontamination Using GFP<br>Adenovirus with Comparable Sensitivity to Flow Cytometry . . . . .<br><i>Michael Grusch, Annemarie Losert, Andreas Lackner, Alev Deli,<br/>Irene Herbacek, and Klaus Holzmann</i>                                                  | 125 |
| 9. Production of Multicistronic HIV-1-Based Lentiviral Vectors. . . . .<br><i>Nachimuthu Chinnasamy, James Shaffer,<br/>and Dhanalakshmi Chinnasamy</i>                                                                                                                                               | 137 |
| 10. Using an EGFPmeter to Evaluate the Lentiviral Vector<br>Production: Tricks and Traps. . . . .<br><i>Claude Bagnis, Pascal Bailly, and Sylvie Chapel-Fernandes</i>                                                                                                                                 | 151 |
| 11. Use of a Macrophage-Tropic GFP-Tagged Human<br>Immunodeficiency Virus Type 1 (HIV-1) to Study Viral Reservoirs . . . . .<br><i>Amanda M. Brown</i>                                                                                                                                                | 165 |

|     |                                                                                                                                                               |     |
