

TABLE OF CONTENT:

1.	INTRODUCTION	6
1.1	A changing world – Current fingerprints of global change	10
1.2	How to preserve biodiversity? – Tools, policies and approaches in conservation biology	18
1.3	Niche-based models - A tool to help anticipating impacts of global change	25
1.4	Objectives & structure of the thesis	31
2.	THREATS TO RARE AND ENDANGERED PLANTS	33
2.1	Rarity types among plant species with high conservation priority in Switzerland	34
2.2	Using niche-based models to improve the sampling of rare species	48
3.	CLIMATE CHANGE IMPACTS ON BIODIVERSITY	67
3.1	Vulnerability of African mammals to anthropogenic climate change under conservative land transformation assumptions	68
3.2	Geographic distribution, niche property and life form of the Southern African flora could explain plants' vulnerability to global change	92
4.	SPREAD OF INVASIVE ALIEN PLANTS	115
4.1	Historical Biogeography of <i>Lactuca serriola</i> L. (Asteraceae) in Europe.	116
4.2	Evidence of climatic niche shift during biological invasion	136
4.3	Predicting current and future biological invasions: both native and invaded ranges matter	151
5.	NICHE DYNAMICS IN SPACE AND TIME	161
6.	SYNTHESIS & PERSPECTIVES	180
6.2	Synthesis & implications in recent literature	181
6.3	Validating assessments of global change impacts	184
6.4	Improving NBM for the assessments of global change impacts	185
6.5	Synergistic interactions between drivers of global change	191
7.	CONCLUSION – A homogenizing world	196
8.	ACKNOWLEDGMENTS	197
9.	REFERENCES	199
10.	ANNEXES	225
	Prediction of plant species distributions across six millennia	
	Why are tetraploid Spotted Knapweeds favored over diploids during biological invasion?	
	Characterization of plastid DNA polymorphisms in <i>Prunus serotina</i> var. <i>serotina</i> (Rosaceae), a North American tree invading Europe
