|                                                                                                                                                                 |         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| 1. Proteins and amino acids .....                                                                                                                               | 1-10    |
| 2. Properties of enzymes .....                                                                                                                                  | 11-16   |
| 3. Nomenclature and classification of enzymes .....                                                                                                             | 17-21   |
| 4. Cofactors and coenzymes .....                                                                                                                                | 22-27   |
| 5. Active site of enzyme. Lock and key hypothesis. Induced fit theory .....                                                                                     | 28-32   |
| 6. Units of enzyme activity and turn over number .....                                                                                                          | 33-37   |
| 7. Effect of pH, temperature, enzyme concentration .....                                                                                                        | 38-44   |
| 8. Enzyme catalysis and kinetics. Derivation of Michaelis- Menton equation. Line-weaver burke plot .....                                                        | 45-64   |
| 9. Enzyme inhibition: reversible and irreversible .....                                                                                                         | 65-76   |
| 10. Regulation of enzyme activity. Allosteric enzymes. Cooperativity, covalent enzyme modulation. Phosphorylation and proteolysis, Multi-enzyme complexes ..... | 77-91   |
| 11. Mechanism of enzyme action. Covalent catalysis and general acid- base catalysis. Feedback inhibition and forward stimulation of enzymes. ....               | 92-104  |
| 12. Clinical and industrial application of enzymes .....                                                                                                        | 105-113 |
| 13. Model questions .....                                                                                                                                       | 114-130 |
