Preface xvii

About the Authors xx

PART I. GENES 1

Chapter 1. Genes Are DNA 2

- 1.1** Introduction 3
- 1.2** DNA Is the Genetic Material of Bacteria, Viruses, and Eukaryotic Cells 4

Historical Perspectives: Determining That DNA Is the Genetic Material 6

- 1.3** Polynucleotide Chains Have Nitrogenous Bases Linked to a Sugar-Phosphate Backbone 6
- 1.4** DNA Is a Double Helix 8
- 1.5** Supercoiling Affects the Structure of DNA 11
- 1.6** DNA Replication Is Semiconservative 12
- 1.7** Polymerases Act on Separated DNA Strands at the Replication Fork 14
- 1.8** Genetic Information Can Be Provided by DNA or RNA 15
- 1.9** Nucleic Acids Hybridize by Base Pairing 17
- 1.10** Mutations Change the Sequence of DNA 19
- 1.11** Mutations May Affect Single Base Pairs or Longer Sequences 20
- 1.12** The Effects of Mutations Can Be Reversed 22
- 1.13** Mutations Are Concentrated at Hotspots 23
- 1.14** Some Hereditary Agents Are Extremely Small 25
- 1.15** Summary 26

Chapter 2. Genes Code for Proteins 29

- 2.1** Introduction 30
- 2.2** Most Genes Code for Polypeptides 31
- Historical Perspectives: One Gene: One Enzyme—George W. Beadle and Edward L. Tatum, 1941*
- 2.3** Mutations in the Same Gene Cannot Complement 33
- 2.4** Mutations May Cause Loss-of-Function or Gain-of-Function 34
- 2.5** A Locus May Have Many Alleles 35
- 2.6** Recombination Occurs by Physical Exchange of DNA 37
- 2.7** The Genetic Code Is Triplet 39
- 2.8** Every Coding Sequence Has Three Possible Reading Frames 42
- 2.9** Bacterial Genes Are Colinear with Their Products 42
- 2.10** Several Processes Are Required to Express the Product of a Gene 43
- 2.11** Proteins Are *trans*-Acting, but Sites on DNA Are *cis*-Acting 46
- 2.12** Summary 47

Chapter 3. The Interrupted Gene 50

- 3.1** Introduction 51
- 3.2** An Interrupted Gene Consists of Exons and Introns 52
- 3.3** Organization of Interrupted Genes May Be Conserved 53

Methods and Techniques: The Discovery of Introns by DNA-RNA Hybridization 56

- 3.4** Exon Sequences Are Conserved but Introns Vary 57
- 3.5** Genes Show a Wide Distribution of Sizes Primarily Due to Intron Size and Number Variation 59
- 3.6** Some DNA Sequences Code for More Than One Polypeptide 61
- 3.7** How Did Interrupted Genes Evolve? 63
- 3.8** Some Exons Can Be Equated with Protein Functions 65
- 3.9** The Members of a Gene Family Have a Common Organization 66
- 3.10** Summary 68

Chapter 4. The Content of the Genome 71

- 4.1** Introduction 72
- 4.2** Genomes Can Be Mapped at Several Levels of Resolution 73
- 4.3** Individual Genomes Show Extensive Variation 74
- 4.4** RFLPs and SNPs Can Be Used for Genetic Mapping 76
- 4.5** Why Are Some Genomes So Large? 77
- 4.6** Eukaryotic Genomes Contain Both Nonrepetitive and Repetitive DNA Sequences 79
- 4.7** Eukaryotic Protein-Coding Genes Can Be Identified by the Conservation of Exons 80
- 4.8** The Conservation of Genome Organization Helps to Identify Genes 83
- 4.9** Some Organelles Have DNA 85

Methods and Techniques: Using mtDNA to Reconstruct Human Phylogenies 86

- 4.10** Organelle Genomes Are Circular DNAs That Code for Organelle Proteins 89
- 4.11** The Chloroplast Genome Codes for Many Proteins and RNAs 91
- 4.12** Mitochondria and Chloroplasts Evolved by Endosymbiosis 92
- 4.13** Summary 94

Chapter 5. Genome Sequences and Gene Numbers 97

- 5.1** Introduction 98
- 5.2** Prokaryotic Gene Numbers Range Over an Order of Magnitude 99
- 5.3** Total Gene Number Is Known for Several Eukaryotes 100
- 5.4** How Many Different Types of Genes Are There? 102
- 5.5** The Human Genome Has Fewer Genes Than Originally Expected 104
- 5.6** How Are Genes and Other Sequences Distributed in the Genome? 106
- 5.7** The Y Chromosome Has Several Male-Specific Genes 107

Methods and Techniques: Tracing Human History through the Y Chromosome 108

- 5.8** Morphological Complexity Evolves by Adding New Gene Functions 110
- 5.9** How Many Genes Are Essential? 112
- 5.10** About 10,000 Genes Are Expressed at Widely Differing Levels in a Eukaryotic Cell 115
- 5.11** Expressed Gene Number Can Be Measured *en Masse* 116
- 5.12** Summary 118

Chapter 6. Clusters and Repeats 121

- 6.1** Introduction 122
 - 6.2** Gene Duplication Is a Major Force in Evolution 123
 - 6.3** Globin Clusters Are Formed by Duplication and Divergence 124
 - 6.4** Sequence Divergence Is the Basis for the Molecular Clock 127
 - 6.5** The Rate of Neutral Substitution Can Be Measured from Divergence of Repeated Sequences 130
- Methods and Techniques: Detecting Selection via Sequence Comparisons* 132
- 6.6** Unequal Crossing-over Rearranges Gene Clusters 132
 - 6.7** Genes for rRNA Form Tandem Repeats Including an Invariant Transcription Unit 137

- 6.8** Crossover Fixation Could Maintain Identical Repeats 139
- 6.9** Satellite DNAs Often Lie in Heterochromatin 143
- 6.10** Arthropod Satellites Have Very Short Identical Repeats 144
- 6.11** Mammalian Satellites Consist of Hierarchical Repeats 145
- 6.12** Minisatellites Are Useful for Genetic Mapping 148
- 6.13** Summary 150

PART II. PROTEINS 154

Chapter 7. Messenger RNA 155

- 7.1** Introduction 156
- 7.2** mRNA Is Produced by Transcription and Is Translated 157
- 7.3** The Secondary Structure of Transfer RNA Is a Cloverleaf 158
- 7.4** The Acceptor Arm and Anticodon Are at Opposite Ends of the tRNA Tertiary Structure 160
- 7.5** Messenger RNA Is Translated by Ribosomes 161
- 7.6** Many Ribosomes Can Bind to One mRNA 162

Methods and Techniques: Demonstrating That Ribosomal Subunits Are Recycled 164

- 7.7** The Cycle of Bacterial Messenger RNA 165
- 7.8** Eukaryotic mRNA Is Modified During or After Its Transcription 167
- 7.9** The 5' End of Eukaryotic mRNA Is Capped 169
- 7.10** The 3' Terminus of Eukaryotic mRNA Is Polyadenylated 170
- 7.11** Bacterial mRNA Degradation Involves Multiple Enzymes 171
- 7.12** Two Pathways Degrade Eukaryotic mRNA 172
- 7.13** Nonsense Mutations Trigger a Surveillance System 174
- 7.14** Eukaryotic RNAs Are Transported 176
- 7.15** mRNA Can Be Localized Within a Cell 177
- 7.16** Summary 178

Chapter 8. Translation 183

- 8.1** Introduction 184
- 8.2** Translation Occurs by Initiation, Elongation, and Termination 185
- 8.3** Special Mechanisms Control the Accuracy of Translation 187
- 8.4** Initiation in Bacteria Needs 30S Subunits and Accessory Factors 188
- 8.5** A Special Initiator tRNA Starts the Polypeptide Chain 190
- 8.6** mRNA Binds a 30S Subunit to Create the Binding Site for a Complex of IF-2 and fMet-tRNA_i 191
- 8.7** Small Eukaryotic Subunits Scan for Initiation Sites on mRNA 193
- 8.8** Elongation Factor Tu Loads Aminoacyl-tRNA into the A Site 195
- 8.9** The Polypeptide Chain Is Transferred to Aminoacyl-tRNA 197
- 8.10** Translocation Moves the Ribosome 198
- 8.11** Elongation Factors Bind Alternately to the Ribosome 199
- 8.12** Uncharged tRNA Causes the Ribosome to Trigger the Stringent Response 200
- 8.13** Three Codons Terminate Translation and Are Recognized by Protein Factors 202

Historical Perspectives: The Naming of the Amber, Ochre, and Opal Codons 204

- 8.14** Ribosomal RNA Pervades Both Ribosomal Subunits 206
- 8.15** Ribosomes Have Several Active Centers 208
- 8.16** Two rRNAs Play Active Roles in Translation 210
- 8.17** Summary 212

Chapter 9. Using the Genetic Code 217

- 9.1** Introduction 218
- 9.2** Related Codons Represent Related Amino Acids 218
- 9.3** Codon-Anticodon Recognition Involves Wobbling 219

- 9.4** tRNA Contains Modified Bases 221
- 9.5** Modified Bases Affect Anticodon–Codon Pairing 222
- 9.6** There Are Sporadic Alterations of the Universal Code 224
- 9.7** Novel Amino Acids Can Be Inserted at Certain Stop Codons 225
- 9.8** tRNAs Are Charged with Amino Acids by Synthetases 226
- 9.9** Aminoacyl-tRNA Synthetases Fall into Two Groups 227
- 9.10** Synthetases Use Proofreading to Improve Accuracy 229
- 9.11** Suppressor tRNAs Have Mutated Anticodons That Read New Codons 230

Medical Applications: Therapies for Nonsense Mutations 232

- 9.12** Recoding Changes Codon Meanings 235
- 9.13** Frameshifting Occurs at Slippery Sequences 236
- 9.14** Bypassing Involves Ribosome Movement 238
- 9.15** Summary 239

Chapter 10. Protein Localization 242

- 10.1** Introduction 243
- 10.2** Protein Translocation May Be Posttranslational or Cotranslational 244

Essential Ideas: Conservation and Function of the Hsp Family of Chaperones 246

- 10.3** The Signal Sequence Interacts with the SRP 248
- 10.4** The SRP Interacts with the SRP Receptor 250
- 10.5** The Translocon Forms a Pore 252
- 10.6** Posttranslational Membrane Insertion Depends on Signal Sequences 253
- 10.7** Bacteria Use Both Cotranslational and Posttranslational Translocation 258
- 10.8** Summary 260

PART III. PROKARYOTIC GENE EXPRESSION 263

Chapter 11. Bacterial Transcription 264

- 11.1** Introduction 265
- 11.2** Transcription Occurs by Base Pairing in a “Bubble” of Unpaired DNA 266
- 11.3** The Transcription Reaction Has Three Stages 267
- 11.4** A Model for Enzyme Movement Is Suggested by the Crystal Structure 269
- 11.5** Bacterial RNA Polymerase Consists of the Core Enzyme and Sigma Factor 271
- 11.6** How Does RNA Polymerase Find Promoter Sequences? 272
- 11.7** Sigma Factor Controls Binding to Promoters 273
- 11.8** Promoter Recognition Depends on Consensus Sequences 276
- 11.9** Promoter Efficiencies Can Be Increased or Decreased by Mutation 278
- 11.10** Supercoiling Is an Important Feature of Transcription 279
- 11.11** Substitution of Sigma Factors May Control Initiation 280
- 11.12** Sigma Factors Directly Contact DNA 282
- 11.13** Bacterial Transcription Termination 283
- 11.14** Intrinsic Termination Requires a Hairpin and a U-Rich Region 284
- 11.15** Rho Factor Is a Site-Specific Terminator Protein 285
- 11.16** Antitermination May Be a Regulated Event 287
- 11.17** Summary 290

Chapter 12. The Operon 294

- 12.1** Introduction 295
- 12.2** Structural Gene Clusters Are Coordinately Controlled 298

Historical Perspectives: An Unstable Intermediate Carrying Information from Genes to Ribosomes for Protein Synthesis 299

- 12.3** The *lac* Operon Is Negative Inducible 300
- 12.4** *lac* Repressor Is Controlled by a Small-Molecule Inducer 301
- 12.5** *cis*-Acting Constitutive Mutations Identify the Operator 303
- 12.6** *trans*-Acting Mutations Identify the Regulator Gene 304
- 12.7** *lac* Repressor Is a Tetramer Made of Two Dimers 305
- 12.8** *lac* Repressor Binding to the Operator Is Regulated by an Allosteric Change in Conformation 307
- 12.9** *lac* Repressor Protein Binds to Three Operators and Interacts with RNA Polymerase 309
- 12.10** The Operator Competes with Low-Affinity Sites to Bind Repressor 310
- 12.11** The *lac* Operon Has a Second Layer of Control: Catabolite Repression 312
- 12.12** The *trp* Operon Is a Repressible Operon with Three Transcription Units 313
- 12.13** Translation Can Be Regulated 314
- 12.14** Summary 316

Chapter 13. Regulatory RNA 320

- 13.1** Introduction 321
- 13.2** Attenuation: Alternative RNA Secondary Structure Control 322
- 13.3** Termination of *Bacillus subtilis trp* Genes Is Controlled by Tryptophan and by tRNA^{trp} 323
- 13.4** The *E. coli* Tryptophan Operon Is Controlled by Attenuation 324
- 13.5** Attenuation Can Be Controlled by Translation 327
- 13.6** A Riboswitch in the 5' UTR Region Can Control Translation of the mRNA 329
- 13.7** Bacteria Contain Regulator sRNAs 330

Medical Applications: Artificial Antisense Genes Can Be Used to Turn Off Viruses and Cancer Genes 332

- 13.8** Eukaryotes Contain Regulator RNAs 332

Methods and Techniques: Microarrays and Tiling Experiments 336

- 13.9** Summary 337

Chapter 14. Phage Strategies 340

- 14.1** Introduction 341
- 14.2** Lytic Development Is Divided into Two Periods 341
- 14.3** Lytic Development Is Controlled by a Cascade 343
- 14.4** Two Types of Regulatory Events Control the Lytic Cascade 345
- 14.5** Lambda Immediate Early and Delayed Early Genes Are Needed for Both Lysogeny and the Lytic Cycle 346
- 14.6** The Lytic Cycle Depends on Antitermination by pN 347
- 14.7** Lysogeny Is Maintained by the Lambda Repressor Protein 349
- 14.8** The Lambda Repressor and Its Operators Define the Immunity Region 350
- 14.9** The DNA-Binding Form of the Lambda Repressor Is a Dimer 351
- 14.10** Lambda Repressor Uses a Helix-Turn-Helix Motif to Bind DNA 352
- 14.11** Repressor Dimers Bind Cooperatively to the Operator 354
- 14.12** Lambda Repressor Maintains an Autoregulatory Circuit 356
- 14.13** Cooperative Interactions Increase the Sensitivity of Regulation 357
- 14.14** The *cII* and *cIII* Genes Are Needed to Establish Lysogeny 358
- 14.15** Lysogeny Requires Several Events 359
- 14.16** The Cro Repressor Is Needed for Lytic Infection 361

Essential Ideas: The Mechanism of pQ Antitermination 363

- 14.17** What Determines the Balance Between Lysogeny and the Lytic Cycle? 363
- 14.18** Summary 374

PART IV. DNA REPLICATION AND RECOMBINATION 368

Chapter 15. The Replicon 369

- 15.1** Introduction 370
- 15.2** An Origin Usually Initiates Bidirectional Replication 371
- Historical Perspectives: The Meselson-Stahl Experiment 372*
- 15.3** The Bacterial Genome Is a Single Circular Replicon 373
- 15.4** Methylation of the Bacterial Origin Regulates Initiation 375
- 15.5** Each Eukaryotic Chromosome Contains Many Replicons 376
- 15.6** Replication Origins Bind the ORC 378
- 15.7** Licensing Factor Controls Eukaryotic Rereplication and Consists of MCM Proteins 379
- 15.8** Summary 382

Chapter 16. Extrachromosomal Replicons 385

- 16.1** Introduction 386
- 16.2** The Ends of Linear DNA Are a Problem for Replication 387
- 16.3** Terminal Proteins Enable Initiation at the Ends of Viral DNAs 388
- 16.4** Rolling Circles Produce Multimers of a Replicon 389
- 16.5** Rolling Circles Are Used to Replicate Phage Genomes 391
- 16.6** The F Plasmid Is Transferred by Conjugation between Bacteria 392
- 16.7** Conjugation Transfers Single-Stranded DNA 393
- 16.8** The Bacterial Ti Plasmid Transfers Genes into Plant Cells 395
- 16.9** Transfer of T-DNA Resembles Bacterial Conjugation 397
- 16.10** Summary 399

Chapter 17. Bacterial Replication Is Connected to the Cell Cycle 402

- 17.1** Introduction 403
- 17.2** Replication Is Connected to the Cell Cycle 403
- Historical Perspectives: John Cairns and the Bacterial Chromosome 405*
- 17.3** The Septum Divides a Bacterium into Progeny That Each Contain a Chromosome 405
- 17.4** Mutations in Division or Segregation Affect Cell Shape 407
- 17.5** *FtsZ* Is Necessary for Septum Formation 408
- 17.6** *min* Genes Regulate the Location of the Septum 409
- 17.7** Chromosomal Segregation May Require Site-Specific Recombination 410
- 17.8** Partitioning Separates the Chromosomes 412
- 17.9** Single-Copy Plasmids Have a Partitioning System 414
- 17.10** Plasmid Incompatibility Is Determined by the Replicon 415
- 17.11** How Do Mitochondria Replicate and Segregate? 416
- 17.12** Summary 417

Chapter 18. DNA Replication 421

- 18.1** Introduction 422
- 18.2** Initiation: Creating the Replication Forks at the Origin 422
- 18.3** DNA Polymerases Are the Enzymes That Make DNA 424
- 18.4** DNA Polymerases Control the Fidelity of Replication 426
- 18.5** DNA Polymerases Have a Common Structure 427
- 18.6** The Two New DNA Strands Have Different Modes of Synthesis 428
- 18.7** Replication Requires a Helicase and Single-Strand Binding Protein 429

- 18.8** Priming Is Required to Start DNA Synthesis 430
- 18.9** DNA Polymerase Holoenzyme Consists of Subcomplexes 433
- 18.10** The Clamp Controls Association of Core Enzyme with DNA 434
- 18.11** Coordinating Synthesis of the Lagging and Leading Strands 435
- 18.12** Okazaki Fragments Are Linked by Ligase 438
- 18.13** Separate Eukaryotic DNA Polymerases Undertake Initiation and Elongation 439
- 18.14** The Primosome Is Needed to Restart Replication 441
- 18.15** Summary 443

Chapter 19. Homologous and Site-Specific Recombination 446

- 19.1** Introduction 447
- 19.2** Homologous Recombination Occurs between Synapsed Chromosomes 448
- 19.3** Double-Strand Breaks Initiate Recombination 450
- 19.4** Recombining Chromosomes Are Connected by the Synaptonemal Complex 454
- 19.5** Specialized Enzymes Catalyze 5' End Resection and Single-Strand Invasion 455
- 19.6** The Ruv System Resolves Holliday Junctions 458
- 19.7** Topoisomerases Relax or Introduce Supercoils in DNA 459

Clinical Applications: Camptothecin and Topoisomerase I Inhibition 462

- 19.8** Site-Specific Recombination Resembles Topoisomerase Activity 463
- 19.9** Yeast Use a Specialized Recombination Mechanism to Switch Mating Type 466

Medical Applications: Trypanosomes Use Gene Switching to Evade the Host Immune System 468

- 19.10** Summary 471

Chapter 20. Repair Systems 475

- 20.1** Introduction 476
- 20.2** Repair Systems Correct Damage to DNA 478

- 20.3** Nucleotide Excision Repair Systems Repair Several Classes of Damage 480

Medical Applications: Xeroderma Pigmentosum 482

- 20.4** Base Excision Repair Systems Require Glycosylases 485
- 20.5** Error-Prone Repair 487
- 20.6** Controlling the Direction of Mismatch Repair 488
- 20.7** Recombination-Repair Systems 491
- 20.8** Nonhomologous End-Joining Also Repairs Double-Strand Breaks 493

Medical Applications: p53 Is the "Guardian of the Genome" 494

- 20.9** Summary 497

Chapter 21. Transposons, Retroviruses, and Retrotransposons 500

- 21.1** Introduction 501
- 21.2** Insertion Sequences Are Simple Transposition Modules 502
- 21.3** Transposition Occurs by Both Replicative and Nonreplicative Pathways 505
- 21.4** Mechanisms of Transposition 508
- 21.5** Controlling Elements Form Families of Transposons in Maize 512

Historical Perspectives: Barbara McClintock, 1950: The Origin and Behavior of Mutable Loci in Maize 513

- 21.6** Transposition of P Elements Causes Hybrid Dysgenesis 516
- 21.7** The Retrovirus Life Cycle Involves Transposition-Like Events 519
- 21.8** Retroviral RNA is Converted to DNA and Integrates into the Host Genome 521
- 21.9** Retroviruses May Transduce Cellular Sequences 524
- 21.10** Retroposons Fall into Three Classes 526
- 21.11** Summary 529

Chapter 22. Immune Diversity 534

- 22.1** Introduction 535
- 22.2** Immunoglobulin Genes Are Assembled from Their Parts in Lymphocytes 537

- 22.3** Light Chains Are Assembled by a Single Recombination 539
- 22.4** Heavy Chains Are Assembled by Two Successive Recombinations 541
- 22.5** Immune Recombination Uses Two Types of Consensus Sequence 543
- 22.6** The RAG Proteins Catalyze Breakage and Reunion 545

Medical Applications: ARTEMIS and SCID-A 548

- 22.7** Class Switching Is Caused by DNA Recombination 548
- 22.8** Somatic Mutation Is Induced by Cytidine Deaminase and Uracil Glycosylase 552
- 22.9** Avian Immunoglobulins Are Assembled from Pseudogenes 554
- 22.10** T Cell Receptors Are Related to Immunoglobulins 555
- 22.11** Summary 557

Chapter 23. Chromosomes 560

- 23.1** Introduction 561
- 23.2** Viral Genomes Are Packaged into Their Coats 562
- 23.3** The Bacterial Genome Is a Supercoiled Nucleoid 564
- 23.4** Eukaryotic DNA Has Loops and Domains Attached to a Scaffold 566
- 23.5** Chromatin Is Divided into Euchromatin and Heterochromatin 567
- 23.6** Chromosomes Have Banding Patterns 569

Methods and Techniques: FISH, Chromosome Painting, and Spectral Karyotyping 570

- 23.7** Polytene Chromosomes Form Bands That Expand at Sites of Gene Expression 571
- 23.8** Centrosomes Often Contain Repetitive DNA 573
- 23.9** *S. cerevisiae* Centromeres Have Short Protein-Binding DNA Sequences 575
- 23.10** Telomeres Have Simple Repeating Sequences 576
- 23.11** Summary 579

PART V. EUKARYOTIC GENE EXPRESSION 582

Chapter 24. Chromatin 583

- 24.1** Introduction 584
 - 24.2** The Nucleosome Is the Subunit of All Chromatin 584
 - 24.3** Nucleosomes Have a Common Structure 586
 - 24.4** Histone Variants Produce Alternative Nucleosomes 590
 - 24.5** DNA Structure Varies on the Nucleosomal Surface 592
 - 24.6** The Path of Nucleosomes in the Chromatin Fiber 594
 - 24.7** Reproduction of Chromatin Requires Assembly of Nucleosomes 596
 - 24.8** Do Nucleosomes Lie at Specific Positions? 598
 - 24.9** DNase Hypersensitive Sites Reflect Changes in Chromatin Structure 601
 - 24.10** An LCR May Control a Domain 602
 - 24.11** Insulators Define Independent Domains 603
- Methods and Techniques: Position Effect Variegation (PEV) and the Discovery of Insulators* 606
- 24.12** What Constitutes a Regulatory Domain? 606
 - 24.13** Summary 608

Chapter 25. Eukaryotic Transcription 612

- 25.1** Introduction 613
- 25.2** Eukaryotic RNA Polymerases Consist of Many Subunits 615
- 25.3** RNA Polymerase I Has a Bipartite Promoter 616
- 25.4** RNA Polymerase III Uses Both Downstream and Upstream Promoters 617
- 25.5** The Startpoint for RNA Polymerase II 619
- 25.6** TBP Is a Universal Factor 621
- 25.7** The Basal Apparatus Assembles at the Promoter 623

25.8 Initiation Is Followed by Promoter Clearance and Elongation 625

25.9 Enhancers Contain Bidirectional Elements That Assist Initiation 627

25.10 Enhancers Work by Increasing the Concentration of Activators Near the Promoter 628

25.11 Summary 630

Chapter 26. Eukaryotic Transcription Regulation 633

26.1 Introduction 634

26.2 Mechanism of Action of Activators and Repressors 635

26.3 Independent Domains Bind DNA and Activate Transcription 639

26.4 Activators Interact with the Basal Apparatus 640

26.5 There Are Many Types of DNA-Binding Domains 641

26.6 Chromatin Remodeling Is an Active Process 643

26.7 Nucleosome Organization or Content May Be Changed at the Promoter 646

26.8 Histone Modification Regulates Chromatin Function 649

26.9 Histone Acetylation Is Associated with Transcription Activation 652

Methods and Techniques: A Tale of Two Nuclei—Tetrahymena thermophila 654

26.10 Methylation of Histones and DNA Is Connected 657

26.11 Promoter Activation Involves Multiple Changes to Chromatin 658

26.12 Histone Phosphorylation Affects Chromatin Structure 660

26.13 How Is a Gene Turned On? 661

26.14 Yeast *GAL* Genes: A Model for Activation and Repression 662

26.15 Summary 664

Chapter 27. Epigenetic Effects Are Inherited 668

27.1 Introduction 669

27.2 Heterochromatin Propagates from a Nucleation Event 670

27.3 Heterochromatin Depends on Interactions with Histones 672

27.4 Polycomb and Trithorax Are Antagonistic Repressors and Activators 675

27.5 X Chromosomes Undergo Global Changes 676

27.6 CpG Islands Are Subject to Methylation 679

27.7 DNA Methylation Is Responsible for Imprinting 681

27.8 Yeast Prions Show Unusual Inheritance 683

27.9 Prions Cause Diseases in Mammals 686

27.10 Summary 687

Chapter 28. RNA Splicing and Processing 691

28.1 Introduction 692

28.2 Nuclear Splice Junctions Are Short Sequences 693

28.3 Splice Junctions Are Read in Pairs 694

28.4 Pre-mRNA Splicing Proceeds through a Lariat 695

28.5 snRNAs Are Required for Splicing 697

28.6 U1 snRNP Initiates Splicing 698

28.7 The E Complex Commits an RNA to Splicing 700

28.8 Five snRNPs Form the Spliceosome 701

28.9 Splicing Is Connected to Export of mRNA 704

28.10 Group II Introns Autosplice via Lariat Formation 705

Medical Applications: Alternative Splicing and Cancer 708

28.11 Alternative Splicing Involves Differential Use of Splice Junctions 708

28.12 *trans*-Splicing Reactions Use Small RNAs 711

- 28.13** Yeast tRNA Splicing Involves Cutting and Rejoining 713
- 28.14** The 3' Ends of mRNAs Are Generated by Cleavage and Polyadenylation 715
- 28.15** Small RNAs Are Required for rRNA Processing 717
- 28.16** Summary 719

Chapter 29. Catalytic RNA 723

- 29.1** Introduction 724
- 29.2** Group I Introns Undertake Self-Splicing by Transesterification 724
- 29.3** Group I Introns Form a Characteristic Secondary Structure 727
- 29.4** Ribozymes Have Various Catalytic Activities 728
- 29.5** Some Group I Introns Code for Endonucleases That Sponsor Mobility 731
- 29.6** Some Group II Introns May Code for Reverse Transcriptases 732
- 29.7** Some Autosplicing Introns Require Maturases 733
- 29.8** Viroids Have Catalytic Activity 734
- 29.9** RNA Editing Occurs at Individual Bases 736
- 29.10** RNA Editing Can Be Directed by Guide RNAs 737
- 29.11** Protein Splicing Is Autocatalytic 740
- 29.12** Summary 742

Chapter 30. Genetic Engineering 745

- 30.1** Introduction 746
- 30.2** Restriction Endonucleases Are a Key Tool in Manipulating DNA 748
- 30.3** Cloning Vectors Are Used to Amplify Donor DNA 749

Methods and Techniques: \$1000 Genome 750

- 30.4** Cloning Vectors Can Be Specialized for Different Purposes 755
- 30.5** Transfection Introduces Exogenous DNA into Cells 757
- 30.6** Genes Can Be Injected into Animal Eggs 758
- 30.7** Gene Targeting Allows Genes to Be Replaced or Knocked Out 761
- 30.8** Summary 765

Glossary 767

Appendix: Answers to Even-Numbered Questions 790
