

Contents

Preface	xv
Chapter 1: Overview	1
1.1 Role of Structural (Molecular) Biology.....	1
1.2 A Short History of Structural (Molecular) Biology.....	2
1.2.1 The Nature of the Problem.....	2
1.2.2 'Imaging' Techniques.....	4
1.2.3 Nuclear Magnetic Resonance.....	6
1.2.4 Fundamental Limitations to Finding Macromolecule Structures.....	7
PART I: FOURIER TRANSFORMS	9
Chapter 2: Correlations and Convolutions	11
2.1 Introducing Correlations.....	11
2.1.1 Cross-Correlations.....	11
2.1.2 Cross-Correlation Functions.....	13
2.1.3 Correlation by Multiplication.....	16
2.1.4 Convolution and Correlation.....	17
2.2 Function Parity.....	18
2.2.1 Even and Odd Functions.....	18
2.2.2 Some Even Functions and Their Cross-Correlation Functions.....	20
2.3 Auto-Correlation Function.....	21
2.3.1 Interpretations of the Auto-Correlation Function.....	21
2.3.2 Locating the Auto-Correlation Function's Central Peak.....	23
Chapter 3: Fourier Fundamentals	25
3.1 Component Functions.....	26
3.2 Fourier Analysis of Periodic Even Functions.....	28
3.2.1 Fourier Components and Diagrams.....	29
3.2.2 Fourier Analysis of a Comb.....	30
3.3 Sines and Phasors.....	30
3.3.1 Fourier Series for Odd Functions.....	30
3.3.2 Representation of Sines: Phasors.....	32
3.3.3 Multiplication of Phasors.....	34
3.3.4 Addition of Phasors.....	35

3.3.5	Phasor Conjugates	35
3.3.6	Phasor-Waves	36
3.3.7	Fourier Series of General Functions.....	38
3.4	Fourier Transforms	39
3.4.1	Fourier Series and Transforms	39
3.4.2	Fourier Transform of a Peak	41
3.4.3	Fourier Inversion	45
3.4.4	Convolution Theorem.....	47
3.4.5	Lattice Sampling and the Convolution Theorem.....	49
3.4.6	Cross-Correlation Functions and the Convolution Theorem.....	50
3.4.7	Translation Rule	51
3.4.8	Choosing a Fourier Transform's Origin	52
3.5	Summary of Rules	52
3.5.1	The Fourier Transform and its Inversion.....	52
3.5.2	Algebraic Rules	53
3.5.3	Isometric Movement Rules	54
3.5.4	Distortion Rules	54
Chapter 4:	Digital Fourier Transforms	55
4.1	Data Preparation	56
4.1.1	Effects of Sampling	56
4.1.2	Digitizing Equations.....	57
4.1.3	A Digital Fourier Transform Example	58
4.1.4	Resolution and Raster Size.....	59
4.1.5	Sampling Frequency and Aliasing	61
4.1.6	Specimen Parameters for Digital Fourier Transforms.....	62
4.2	Digital Fourier Transform Features	63
4.2.1	Amplitude Scaling Rules.....	63
4.2.2	Sub-Periods	65
4.3	Digital Fourier Transform Calculations.....	67
4.3.1	Basic Calculation	67
4.3.2	Fast Fourier Transforms: Introduction	69
4.3.3	Fast Fourier Transforms: Essential Tricks.....	70
4.4	Appendix.....	72
4.4.1	Amplitude Scaling Rules.....	72
Chapter 5:	Filters	75
5.1	Introduction.....	75
5.1.1	Concept of a Filter.....	75
5.1.2	Operation of Simple Filters	76
5.2	Blurring Filters.....	77
5.2.1	The Rectangle Filter	77
5.2.2	Convergence to Equality	78
5.3	Digital-to-Analog Conversion	82
5.3.1	Interpolation of Sampled Curves.....	83
5.3.2	Sampling Theorem	84

5.4	Correcting Blurring Filters	86
5.4.1	Contrast Transfer Function Correction: Wiener Filtering	87
5.4.2	Blur-Correcting Filters: General Approach	87
5.4.3	Sharpening Filters	88
5.5	Gradients and Derivatives	89
5.5.1	Introductory	89
5.5.2	Fourier Transforms of Gradient Function	90
5.5.3	Fourier Transforms of Impulse Response	94
Chapter 6: Two-Dimensional FTs		95
6.1	Two-Dimensional Fourier Transforms Rules	95
6.1.1	Transition from One-Dimensional to Two-Dimensional	95
6.1.2	Rule Changes in Two-Dimensional Fourier Transforms	96
6.1.3	Rule Changes in Three-Dimensional Fourier Transforms	100
6.2	Points and Lines	101
6.2.1	Lines and Lattices	101
6.2.2	Reciprocal Lattice and Crystal Planes	105
6.2.3	Unit Cell Contents	106
6.3	Polygons	108
6.3.1	Auto-Correlation Functions of 'Point Polygons'	108
6.3.2	Fourier Transforms of 'Point Polygons'	109
6.3.3	Uniform Polygons and the Sampling Theorem	112
6.4	Polar Coordinates	115
6.4.1	Jinc-Function	115
6.4.2	Bessel Functions: J_0	116
6.4.3	Bessel Functions: Higher Orders	119
PART II: OPTICS		123
Chapter 7: Microscopy with Rays		125
7.1	Light Microscopy	125
7.1.1	Pinhole Camera	125
7.1.2	Single Lens Microscope	126
7.1.3	Compound Microscope	129
7.1.4	Chromatic Aberration and Geometrical Aberrations	131
7.1.5	Rotationally Symmetric Aberrations	133
7.1.6	Lack of Rotational Symmetry	134
7.2	Electron Microscopy	136
7.2.1	The Basic Electron Microscope	136
7.2.2	Improvements on the Basic Electron Microscope	138
7.2.3	Electron Microscope Preparation Techniques	140
7.3	Electron Lens Aberrations	141
7.3.1	Chromatic Aberration	142
7.3.2	Geometrical Aberrations	142

7.4	Contrast Mechanisms	143
7.4.1	Elastic and Inelastic Scattering	143
7.4.2	Phase Contrast: General Considerations	145
7.4.3	Refraction (Phase) Contrast Through Defocus	146
7.4.4	Analyzing Election Microscope Imaging Defects	148
7.4.5	Impulse Response	148
Chapter 8:	Waves	151
8.1	Wave Properties	151
8.1.1	What are Waves?	151
8.1.2	Introducing Diffraction	154
8.2	The Quantum Electron	155
8.2.1	Electrons as Waves	155
8.2.2	Waves Versus Particles	156
8.3	Fresnel Diffraction	157
8.3.1	Two-Slit Diffraction	157
8.4	Fraunhofer Diffraction	160
8.4.1	Fraunhofer Means Fourier Transforms	160
8.4.2	Optical Diffraction	161
8.4.3	General Fraunhofer Diffraction: Reflection/Ewald Sphere	163
8.5	Appendix	164
8.5.1	Resonance Links Scattering with Spectroscopy	164
8.5.2	Large Circle Approximation	166
Chapter 9:	Wave Imaging	169
9.1	Overview of Wave Imaging	169
9.1.1	Double Diffraction Imaging	169
9.2	Defocus	172
9.2.1	The (Flattened) Reference Sphere	172
9.2.2	Thin Sinusoidal Specimen-Components	173
9.2.3	Double-Diffraction Perfect Imaging	175
9.2.4	Defocused Imaging	177
9.2.5	How Defocus Affects Amplitude/Phase Contrast	179
9.2.6	How Phase Contrast Transfer Function Depends on Defocus, Wavelength and Spatial Frequency	181
9.2.7	Phase Contrast Transfer Function Correction	184
9.3	Other Aberrations	185
9.3.1	Astigmatism	185
9.3.2	Spherical Aberration	185
9.3.3	Odd Aberrations: Coma	187
9.4	Appendix: Aberration Phase-Shift Geometry	188
PART III:	GENERAL STRUCTURAL METHODS	189
Chapter 10:	Symmetry	191
10.1	Principles	191

10.1.1	Introduction to Symmetry	192
10.1.2	Symmetry Operations	193
10.1.3	Combinations of Symmetry Operations: Groups	195
10.2	One-Translation Groups	198
10.2.1	One-Dimensional Groups	198
10.2.2	Frieze Groups	199
10.2.3	Helices	202
10.3	Two-Translation Groups	203
10.3.1	General Principles	203
10.3.2	'One-Sided' or 'Projection' Plane Groups	204
10.3.3	'Two-Sided' Plane Groups	206
10.4	Three-Translation Groups	211
10.4.1	Rotations in Three-Dimension	212
10.4.2	Platonic Solids	213
10.4.3	Crystallographic Groups in Three-Dimension	215
10.5	Fourier Transforms of Crystallographic Symmetry Operations	218
10.5.1	Translations	218
10.5.2	Rotations	219
10.5.3	Screw Axes	220
Chapter 11: Statistics and Matrices		223
11.1	Statistics	223
11.1.1	Basic Principles	223
11.1.2	Fourier Transforms of Noise	227
11.1.3	Average Value of Measurements	228
11.1.4	Accuracy of Measurements	229
11.1.5	Straight-Line Fits	229
11.1.6	Principal Component Analysis	231
11.1.7	Interpolation of Fourier Transforms	232
11.2	Matrices	234
11.2.1	Uniform Distortion and Matrix Eigenvalue Methods	235
11.2.2	Multidimensional Energy Surfaces	237
11.2.3	Energy Minimization in Simple Systems	238
11.2.4	Optimization of Alignment Parameters	240
11.3	Structure Optimization and Simulation	240
11.3.1	Energy Minimization in Complex Systems	240
11.3.2	Structure Refinement: NMR Compared with Images	241
11.3.3	Dynamics and Normal Vibration Modes	243
11.4	Appendix	246
11.4.1	Random Walk	246
Chapter 12: The Third Dimension		247
12.1	Depth Through Tilting	247
12.1.1	The 'Viewing-Sphere' and its Fourier Transform	247
12.1.2	Tilts and Three-Dimensional Resolution	250

12.1.3 Tilts from Symmetry	251
12.1.4 Collecting Tilt Data	253
12.2 Aligning Particle Images	255
12.2.1 Overview of Alignment Methods	255
12.2.2 Three Translations and Three Rotations (3T + 3R) Define a Particle's Orientation and Position	256
12.2.3 Representing Rotations: Eulerian and Spherical Polar Angles	258
12.2.4 Classifying the (3T + 3R) Alignment Parameters	258
12.3 Information Content of Particle Images	260
12.3.1 Original Images	260
12.3.2 Information, Resolution and Fourier Transforms	264
12.4 Three-Dimensional Reconstruction: Principles	267
12.4.1 Fourier Three-Dimensional Reconstruction and Back-Projection	267
12.4.2 An Example in Both Real and Fourier Space	269
12.4.3 Improving Naïve Reconstructions	272
12.4.4 Refinement and Chirality	273
PART IV: SYMMETRY-BASED METHODS	275
Chapter 13: X-Ray Crystallography	277
13.1 Introduction	277
13.1.1 Thick Specimens	277
13.1.2 X-Ray Study of Thick Crystals	278
13.2 Specimen and Data Collection	279
13.2.1 Protein Crystals	279
13.2.2 Instrumentation	280
13.2.3 Collecting a Data-Set	281
13.2.4 Preliminary Analysis of the Data-Set	285
13.3 <i>Ab Initio</i> Phasing	285
13.3.1 The Phase Problem	285
13.3.2 Adding a Heavy Atom and Finding its Position	287
13.3.3 Getting the Phase Information	287
13.3.4 Changing the X-Rays: Anomalous Scattering	289
13.3.5 Applications of Isomorphous Replacement and Anomalous Scattering	293
13.4 Other Phasing Methods	294
13.4.1 External Information, Same Lattice: The Difference Fourier	294
13.4.2 External Information, Different Lattice: Molecular Replacement	295
13.4.3 Internal Information: Redundancy	296
Chapter 14: Crystalline Sheets	299
14.1 Electrons Versus X-Rays	299
14.1.1 Differences	299
14.1.2 The Specimen	300
14.1.3 Image Analysis	301
14.2 Electron Diffraction	301

14.2.1	Uses	301
14.2.2	Tilt Geometry: The Missing Cone	302
14.2.3	Making and Processing the Records	304
14.3	Two-Dimensional Imaging	306
14.3.1	Feasibility	306
14.3.2	Projections	307
14.4	Three-Dimensional Imaging	307
14.4.1	Collecting and Assembling Data	308
14.4.2	Correcting for Contrast Transfer Function: The Tilt Transfer Function	308
Chapter 15: Helices		311
15.1	Helical Symmetry and Structure	312
15.1.1	Helical Symmetry Groups	312
15.1.2	Helical Lattices Without Rotational Symmetry	313
15.1.3	Helical Lattices with Rotational Symmetry	315
15.1.4	Relation of Helices to Sub-Structures	316
15.2	Helical Fourier Transforms	317
15.2.1	Cylindrical (φ, z) Fourier Transform and (n, Z) Diagram	317
15.2.2	Radial Fourier Transform: Amplitudes	324
15.2.3	Radial Fourier Transform: Phases	327
15.2.4	Overall Fourier Transform: Atoms	327
15.2.5	G-Functions and Radial Inversion	329
15.3	Getting a Structure from Helical Diffraction Data	330
15.3.1	Indexing	330
15.3.2	Interfering Layer-Lines	333
15.3.3	Tilt Correction	334
15.3.4	Handedness	334
15.3.5	Averaging Data from Different Particles	334
Chapter 16: Icosahedral Particles		337
16.1	Deltahedra	338
16.1.1	'Platonic' Polyhedra	338
16.1.2	Viral Capsids	341
16.1.3	Curvature of Deltahedra	342
16.2	Projections	344
16.3	Three-Dimensional Reconstruction	346
16.3.1	Common Lines	347
16.3.2	Cryo-Image Problems	350
16.3.3	Polar Fourier Transforms	352
16.3.4	Other Methods for Finding Particle Orientations	354
16.3.5	Fourier Transform Interpolation and Inversion	354
16.4	Appendix: Calculation of T-numbers	356
Chapter 17: Unsymmetrical ('Single') Particles		359
17.1	Introduction	359

17.1.1	The Reasons for Single-Particle Methods	360
17.2	Alignment	361
17.2.1	Reference-Free Alignment of Particles Differing by $(2T + R)$	361
17.2.2	Alignment of Particles Differing by $(2T + 3R)$	362
17.2.3	The Reference Particle Problem	363
17.3	Multivariate Statistical Analysis	364
17.3.1	The Need for Statistics	364
17.3.2	Multivariate Statistical Analysis Pre-Processing	365
17.3.3	Multivariate Statistical Analysis Processing	365
17.3.4	Multivariate Statistical Analysis: Interpretation of Factor Space	366
17.3.5	The Uses of Multivariate Statistical Analysis	368
17.3.6	Classification	368
17.4	Reconstruction	369
17.4.1	Data Assembly: Topology	370
17.4.2	Data Assembly: Geometry	370
17.4.3	Reconstruction Methods	372
17.4.4	Refinement	373
Chapter 18: Distortion Correction		375
18.1	Introduction	375
18.1.1	Earlier Distortion Studies	375
18.1.2	Overview of Correction Process	376
18.2	Crystalline Sheets	377
18.2.1	Fourier Transforms	377
18.2.2	Cross-Correlation Functions	377
18.3	Helices	379
18.3.1	Linear Distortions	379
18.3.2	Three-Dimensional Linear Distortion	379
18.3.3	Segmental Correction Using Fourier Transforms	381
18.3.4	Helices: Projection Matching in Real Space	382
18.3.5	Distortion Correction of 'Crystallographic' Structures	383
PART V: MATHEMATICAL BASIS		385
Chapter 19: FT Mathematics		387
19.1	Introduction	387
19.2	Algebra	388
19.2.1	Elementary Algebra	388
19.2.2	Exponential Function	389
19.3	Geometry	390
19.3.1	Trigonometry	390
19.3.2	Complex Numbers (Phasors): Algebra	391
19.3.3	Complex Numbers: Geometry	392
19.4	Infinitesimals	392
19.4.1	Exponential Function	392
19.4.2	Exponential Function in the Complex Plane	393

19.5 Calculus	394
19.5.1 Areas and Gradients	395
19.5.2 Calculus: Essential Details	396
19.5.3 Calculus: Important Examples	397
19.5.4 The Fourier Transform	399
Chapter 20: Elementary Matrices.....	401
20.1 Introducing Matrices.....	401
20.1.1 From One-Dimension to Two-Dimensions: Vectors	401
20.1.2 Equation-Pairs and Matrices	402
20.1.3 Matrix Multiplication	403
20.2 Matrix Inversion	404
20.2.1 Solving a Simple Matrix Equation.....	404
20.2.2 Error-Sensitivity	405
20.2.3 Infinitesimal Matrices	407
20.2.4 Rotation Matrices	407
20.3 Eigenvectors.....	409
20.3.1 Eigenvalues and -vectors.....	409
20.3.2 Matrix Diagonalization	410
20.4 Least-Squares Fits.....	411
20.4.1 Rectangular Matrices	411
20.4.2 Straight-Line Fits	412
20.4.3 Principal Component Analysis.....	414
References	417
Index.....	427
