

CONTENTS

- 1. Introduction** 1—27
Life Outside the Solar System.
- 2. Molecular Origin of Life** 28—55
Theories of Origin, Theory of Eternity of Present Conditions, Theory of Special Creation, Theory of Spontaneous Generation or Abiogenesis, Theory of Catastrophism, Cosmozoic Theory or Theory of Panspermia, Modern Concepts on the Origin of Life, Theory of Organic Evolution, Task, Possible and Impossible, Organic Molecules, Forces of Dissolution, Forces of Integration, First Organisms, Sources of Energy, Life's Capital.
- 3. Evolutionary Age of Earth** 56—69
Geological Time Scale, Eras, Periods, Epoches, Azoic Era, Archaeozoic Era, Proterozoic Era, Palaeozoic Era, Cambrian Period, Ordovician Period, Silurian Period, Devonian Period, Mississippian Period, Pennsylvanian Period, Permian Period, Mesozoic Era, Triassic Period, Jurassic Period, Crataceous Period, Cenozoic Era, Tertiary Period, Quaternary Period.
- 4. Evolutionary Changes in Gene** 70—106
Cell Division, Mendelian Segregation and Assortment, Principle of Segregation, Principle of Independent Assortment, Dominance Relations and Multiple Alleles, Exceptions to Mendelism, Sex Linkage, Linkage and Recombination, Chromosomal Variations in Number, Chromosomal Variations in Structure, Deletions or Deficiencies, Duplications, Inversions, Translocation, Chromosomal Evolution in *Drosophila* and Primates, Gene Mutations, Regulatory

Mutations, Quantitative Variation, Mutation Rates, Transposons, Repeated Sequences, and Selfish DNA, Randomness of Mutation, Genetic Polymorphism: Widespread Nature of Variability.

5. Molecular Fluctuation

107—151

Gross Gene Deletions in Evolution, Gross Gene Deletions during Primate Evolution, Gross Deletional Polymorphisms, Microdeletions in Evolution, Microdeletions in Pathology, Microdeletions Mediated by Direct Repeats, Microdeletions Mediated by Inverted Repeats, Microdeletions in Vertebrate Evolution, Microinsertions in Evolution, Gene Coding Region Microinsertions, Microinsertion Polymorphisms, Indels, Insertion of Transposable Elements in Evolution, Endogenous Retroviral Sequences and Transposable Elements, LINE Elements, Alu Sequences, Gross Gene Duplications in Evolution, Duplications and the Emergence of Paralogous Genes, Intra-chromosomal Regional Duplication, Tandem Duplications, Translocation of Duplicated Genes, Duplication of Translocated Genes, Syntenic Relationships and Gene Dispersal, Functional Redundancy and Post-duplication Diversification, Truncated Gene Copies, Duplication Polymorphisms, Intragenic Gene Duplications in Evolution, Multi-exon Duplications, Exon Duplication, Intra-exonic Duplications, Emergence of Primordial Genes by Oligomer Duplication, Intragenic Duplication Polymorphisms, Coding Sequence Expansion and Contraction Resulting from the Introduction or Removal of Initiation and Termination codons, Minisatellites, Microsatellites and Telomeric Repeats, Minisatellite DNA Sequences, Microsatellite DNA Sequences, Telomeric and Centromeric Repetitive DNA, Expansion of Unstable Repeat Sequences, Triplet Repeat Expansion Disorders, Nature and Distribution of Triplet Repeats in the Human Genome, Origin of Expanded Triplet Repeats, Evolution of Repeat Number in the Genes Underlying Disorders of Triplet Repeat Expansion, Unique Case of Involucrin.

6. Strength of Genes

152—176

Mutation Rates, Selection, Heterozygous Advantage, Selection and Polymorphism, Kinds of Selection, Equilibrium between Mutation and Selection, Migration, Random Genetic Drift.

7. Advanced Genes

177—201

Nature of Gene, Genes are Units of Molecular Structure, Genes are Highly Individual, Genes are Working Molecules of the Cell, Genes are Aware of their Surroundings, Types of Evolutionary

Change in Genes, Fluctuations in Gene Frequencies, Change in Gene Structure, Adaptation, Advancement, Principles of Evolutionary Advancement, Tautology of Advancement, Preadaptation, Autopoiesis, Evolutionary Function, Evolution of Phenotype, Tautology of Advancement, Preadaptation, Autopoiesis, Evolutionary Function, Relationship of Advancement to Adaptation and Change, Rates of Evolution, Endogenous versus Exogenous Cause for Evolution.

8. Genes in Society 202—225

Changes in Allele Frequencies, Natural Selection, Codominance, Overdominance, Random Genetic Drift, Effective Population Size, Gene Substitution, Fixation Probability, Fixation Time, Rate of Gene Substitution, Extinction of an Allele under Mutation Pressure, Genetic Polymorphism, Neo-Darwinian theory and Natural Mutation Hypothesis.

9. Gene Efficiency 226—245

Mutationists and Selectionists, Neo-Darwinian Synthesis, Populations and Gene Frequencies, Conservation of Gene Frequencies, Attainment of Equilibrium at Two or More Loci, Sex Linkage, Equilibria in Natural Populations, Inbreeding.

10. Evolution of Human Genes 246—282

Consequences of Genome Duplications for Gene Evolution, Mammalian Genome Evolution, Primate Evolution, Adaptation and Adaptive Radiation, Primate Phylogeny, Chromosome Evolution in Primates, Evolution of the Human Sex Chromosomes and the Pseudoautosomal Regions, Evolution of the Mitochondrial Genome, Evolution of Human Populations, Action of Natural Selection in Human Populations, Sequencing the Genomes of Model Organisms and Humans.

11. Molecular Events in Evolution 283—307

Evolution of Whole Genome, Arrangement of Genes, Gene Clusters, Gene Family, Coding of Genes by DNA, Tandem Repeats, Scattered Repeats, Selfish DNA, Minisatellites (Short Repeats), Scattered Repeats, C-factor Paradox.

12. Fundamental Gene Variation 308—318

Protective Effect of Genetic Redundancy, Protective Effect of Genetic Subdivision, 'Split' Genes, Discussion.

Index 319—325
