1 Plant Metabolomics in a Nutshell: Potential and Future Challenges	1
<i>Robert D. Hall</i>	
1.1 The history and the goals of plant metabolomics	1
1.2 The technologies	4
1.2.1 Extraction, separation and detection	6
1.2.2 Data generation, storage, processing and mining	7
1.3 The applications	10
1.3.1 Metabolomics and fundamental plant research	11
1.3.2 Metabolomics and applied plant research	13
1.4 The bottlenecks, the potential and future challenges	15
1.4.1 Current limitations	16
1.4.2 Future potential	18
1.4.3 Challenges for the future	19
Acknowledgements	20
References	20
2 Metabolite Analysis and Metabolomics in the Study of Biotrophic Interactions between Plants and Microbes	25
<i>John Draper, Susanne Rasmussen and Hassan Zubair</i>	
2.1 Introduction	26
2.2 Biotrophic phases of interactions between fungal pathogens and plant hosts	28
2.2.1 Hemi-biotrophic interactions between <i>Magnaporthe grisea</i> and grass hosts	29
2.2.2 Infection of cereal hosts by the obligate pathogen <i>Blumeria graminis</i>	33
2.2.3 Interactions between maize and smut pathogen <i>Ustilago maydis</i>	34
2.3 Mutualistic plant associations with endosymbionts	36
2.3.1 Legume – rhizobium associations	37
2.3.2 Plant root – arbuscular mycorrhizal associations	40
2.3.3 Neotyphodium – grass associations	43

2.4	Conclusions, horizon scanning & future impact	45
2.4.1	Common aspects of biotrophic interactions derived from metabolite analyses	46
2.4.2	Technical challenges remaining in the study of biotrophic interactions	47
	References	49
3	Abiotic Stress and Metabolomics	61
	<i>Jairus Bowne, Antony Bacic, Mark Tester and Ute Roessner</i>	
3.1	Introduction	61
3.2	What is abiotic stress and how does it impact crop production?	63
3.3	Abiotic stress adaptation and tolerance mechanisms: molecular and physiological approaches	64
3.4	Metabolomics	65
3.4.1	Gas chromatography-mass spectrometry	66
3.4.2	Liquid chromatography-mass spectrometry	68
3.4.3	Capillary electrophoresis-mass spectrometry	69
3.4.4	Nuclear magnetic resonance	69
3.5	Impact of abiotic stress on plant metabolism	70
3.5.1	Drought	71
3.5.2	Cold stress	72
3.5.3	Salinity	73
3.6	Integration of 'omics and physiological data	74
3.7	How can technological improvements assist in data interpretation?	75
3.8	Where do we go from here?	76
	References	77
4	A Role for Metabolomics in Plant Ecology	87
	<i>Nicole M. van Dam and Eddy van der Meijden</i>	
4.1	A plant is never alone	88
4.2	Applying metabolomics to wild plant species: yes we can!	89
4.3	Plant metabolomics and chemical ecology of plant-insect interactions: some success stories	92
4.3.1	The chemical consequences of hybridization in plants	92
4.3.2	The search for resistance traits	93
4.3.3	Genotype x environment interactions in plant chemistry	94
4.4	Plant metabolomics helps to advance theories in plant insect interactions	96

4.4.1	Optimal defence theories: unravelling different plant defence strategies	96
4.4.2	Testing theories of invasive plant species biology	99
4.5	Metabolomics for plant ecology in the future: possibilities and pitfalls	101
	References	102
5	Metabolomics of a Model Fruit: Tomato	109
	<i>Ric C.H. de Vos, Robert D. Hall and Annick Moing</i>	
5.1	Introduction	110
5.1.1	Tomato as a model for fleshy fruit	110
5.1.2	Metabolomics techniques in tomato fruit research	111
5.1.3	Tomato metabolite databases	118
5.2	A few key examples of the broad relevance of tomato fruit metabolomics	120
5.2.1	Tomato metabolomics and human nutrition	120
5.2.2	Metabolomics for quality diagnostics of tomato fruit and their products	127
5.2.3	Genetical metabolomics in tomato	130
5.2.4	Tomato metabolomics and functional genomics studies	132
5.3	Predictions for the future	137
5.3.1	High throughput strategies	137
5.3.2	Micrometabolomics, metabolite compartmentation and imaging	139
5.3.3	Metabolite identification and databases	140
5.3.4	Data integration between metabolomics platforms and between omics strategies	142
5.4	Conclusions	143
	Acknowledgements	144
	References	144
6	Metabolomics of <i>Arabidopsis thaliana</i>	157
	<i>Michael H. Beale and Michael R. Sussman</i>	
6.1	Introduction	157
6.2	The <i>Arabidopsis</i> metabolome	159
6.3	Measuring the <i>Arabidopsis</i> metabolome	162
6.3.1	Technology and methodology	163
6.3.2	Putting the technology into practice: targeted vs. untargeted metabolomics	166
6.4	Metabolomics and <i>Arabidopsis</i> molecular plant physiology	168
6.5	Metabolomics in <i>Arabidopsis</i> functional genomics	170
6.6	Genetical metabolomics	172

6.7	Forward look	173
	Acknowledgements	174
	References	174
7	Crops and Tasty, Nutritious Food – How Can Metabolomics Help? <i>Derek Stewart, Louise V.T. Shepherd, Robert D. Hall and Paul D. Fraser</i>	181
7.1	Every food chain begins with plants	182
7.2	Potato and tomato – both fresh and processed	182
7.2.1	Potato metabolomics	183
7.2.2	Fresh tomatoes	185
7.2.3	Tomato puree – a model for the food processing industry?	187
7.3	Grain crops	188
7.3.1	The cereals	188
7.3.2	Rice metabolomics	190
7.4	Soft fruit metabolomics	192
7.5	Metabolomics and our most important beverages – coffee, tea and wine	194
7.5.1	Coffee metabolomics	194
7.5.2	Tea metabolomics	196
7.5.3	Grapes and wine	198
7.6	Food product contamination and adulteration	200
7.7	Metabolite profiling technologies used to evaluate crop safety	201
7.7.1	The generation and standardization of the biological material	201
7.7.2	Evaluation of novel foodstuffs using targeted metabolite profiling	202
7.7.3	Evaluation of novel foodstuffs using metabolomic and chemical fingerprinting	203
7.7.4	Metabolomics in the development and evaluation of GM crops	205
7.7.5	Non-targeted approaches and detection of unintended effects	206
7.8	The future importance of metabolomics in crop research	206
	Acknowledgements	208
	References	208
8	Genetics, Genomics and Metabolomics <i>Alisdair R. Fernie and Joost J.B. Keurentjes</i>	219
8.1	Introduction	220
8.2	Genetic understanding of metabolism in the pre-genomics era	221

8.2.1	The potential of natural diversity	221
8.2.2	From single target to untargeted approaches	225
8.3	Genetic analysis of natural variance in plants – RILs and NILs	226
8.4	Analysis of crop natural variance and broad genetic populations	230
8.5	Linking genotypic and phenotypic diversity	233
8.6	Finding the mechanisms underlying the QTL	235
8.7	Integration of omic data with physiological traits	238
8.8	Metabolomics aiding the understanding of quantitative genetics	241
8.9	Perspective of metabolomics assisted breeding	243
8.9.1	Conventional mapping based approaches	243
8.9.2	Combining metabolomics and association mapping	243
8.10	Concluding remarks and perspective	244
	References	246
9	Data Integration, Metabolic Networks and Systems Biology <i>Henning Redestig, Jędrzej Szymanski, Masami Y. Hirai, Joachim Selbig, Lothar Willmitzer, Zoran Nikoloski and Kazuki Saito</i>	261
9.1	Introduction	261
9.2	Combining multiple metabolomics platforms	262
9.2.1	Current applications of multi-platform-based metabolomics	263
9.2.2	Our example data set	264
9.2.3	Analysis of multi-platform data sets	265
9.2.4	Mid-level data fusion	266
9.2.5	Low-level data fusion	270
9.2.6	Conclusion	274
9.3	Integrating transcriptome and metabolome data	275
9.3.1	Emergence of omics in plant physiology	275
9.3.2	Integration of omics for systematic understanding of a whole plant	276
9.3.3	Integration of transcriptome and metabolome data into a single matrix	276
9.3.4	Global understanding of physiological phenomena and gene functional identification by relating metabolome to transcriptome	278
9.3.5	Application of public transcriptome data sets	279
9.3.6	Visualization of transcriptome and metabolome data on metabolic map	279

9.3.7	Multivariate analysis and classification of genes and metabolites	280
9.3.8	A wide range of applications of integrated transcript and metabolite profiling	280
9.3.9	Future perspective	284
9.4	Network inference in metabolomics	284
9.4.1	Coverage of metabolic pathways by MS data	285
9.4.2	Goals of <i>de novo</i> metabolic network reconstruction	286
9.4.3	Relevance networks	287
9.4.4	Refining relevance networks	291
9.4.5	Bayesian networks	294
9.4.6	Summary	297
9.5	Metabolomics: the bridge between constraint-based and kinetic modelling	298
9.5.1	Plant-specific genome-scale metabolic networks	299
9.5.2	Classical flux balance analysis	299
9.5.3	Dynamic flux balance analysis	305
9.5.4	Challenges and opportunities	306
	Acknowledgements	306
	References	306
10	Progress in Chemometrics and Biostatistics for Plant Applications, or: A Good Red Wine is a Bad White Wine <i>Joachim Kopka, Dirk Walther, J. William Allwood and Royston Goodacre</i>	317
10.1	Introduction	318
10.2	A metabolomic association analysis of enological wine quality	320
10.2.1	Study design	320
10.2.2	Simple questions are the best: which metabolites characterize a red compared to a white wine?	323
10.2.3	Hierarchical cluster analysis and principal component analysis are routine tools: are common markers for the quality classification of red and white wines to be expected?	325
10.2.4	Data reduction without loss of relevant information is a major challenge: considering conditional aspects of white wine quality	329
10.2.5	Finding associations: which metabolites best reflect the enological quality of wine?	333
10.2.6	Finding sample classification rules: which metabolites allow best prediction of enological quality of wine?	336

10.3	Conclusion: standard operating procedures for metabolomic data mining	339
	Acknowledgements	340
	References	341
11	Spatially Resolved Plant Metabolomics	343
	<i>Lloyd W. Sumner, Dong Sik Yang, Bennie J. Bench, Bonnie S. Watson, Chao Li and A. Daniel Jones</i>	
11.1	Introduction	344
11.1.1	Spatially resolved primary metabolism	344
11.1.2	Spatially resolved secondary metabolism	346
11.2	Current applications of spatially resolved metabolomics in plant biology	348
11.2.1	Metabolomics of <i>Medicago truncatula</i> floral organs	348
11.2.2	Metabolite profiling of alfalfa trichomes	354
11.2.3	Spatially resolved metabolomics of alfalfa (<i>Medicago sativa</i>) border cells and roots	356
11.3	Metabolite imaging	357
11.3.1	Mass spectrometric imaging of trichomes	358
11.4	Current challenges and future directions of plant metabolomics	358
11.4.1	Metabolite annotation and depth-of-coverage	359
11.4.2	Instrumental sensitivity and dynamic range	360
11.4.3	Temporally and spatially resolved metabolomics	360
	Acknowledgements	361
	References	362
12	Data Processing, Metabolomic Databases and Pathway Analysis	367
	<i>Oliver Fiehn, Tobias Kind and Dinesh Kumar Barupal</i>	
12.1	Introduction	368
12.2	Data processing and identification of plant metabolites	369
12.2.1	Gas chromatography – mass spectrometry (GC-MS)	371
12.2.2	Direct infusion nanoelectrospray – tandem mass spectrometry	374
12.2.3	Liquid chromatography – tandem mass spectrometry	377
12.3	Compound-centric metabolomic databases and genomic pathway repositories	380
12.3.1	Databases linking metabolomic data to compound information	382
12.3.2	Linking compounds to chemical and biological information	387

12.3.3	Reconstructing plant genomic information towards enzymes and pathways	391
12.4	Mapping and visualization of metabolomic data to biochemical pathways	395
12.4.1	Pathway maps	395
12.4.2	Mapping to metabolic modules	396
12.4.3	Network topology and graph layouts	397
12.5	Conclusions	398
