

DIRECTORY OF NOTEBOOK FIGURES **TO ACCOMPANY** **LEWIS, GAFFIN, HOEFNAGELS, & PARKER** **LIFE, 5/e**

Chapter 1

Levels of biological organization reveal
common features of all life Figure 1.1
An emergent property—from tiles to tubes
Figure 1.2
Life is connected Figure 1.3
Organizing Life's Diversity Figure 1.7
The scientific method is a means of careful
discovery Figure 1.8
Experiments follow rules Figure 1.10

Chapter 2

The periodic table of elements Figure 2.1
Atoms have structure Figure 2.2
Structures of the atoms prevalent in life
Figure 2.3
Electron orbitals determine molecular shape
Figure 2.4
Covalent bonds form molecules Figure 2.5
Different types of diagrams are used to
represent molecules Figure 2.6
Carbon atoms form four covalent bonds
Figure 2.7
Polar covalent bonds Figure 2.8
Table salt, an ionically bonded molecule
Figure 2.9
Solutions are mixtures of molecules
Figure 2.10
The pH scale Figure 2.11
Carbohydrates can be simple or complex
Figure 2.13
Complex carbohydrates have multiple
functions Figure 2.14
Lipids form complex molecules
Figure 2.15
Lipids in cell membranes Figure 2.16
Amino acids join to form peptides
Figure 2.18
Four levels of protein structure
Figure 2.20
Enzyme action Figure 2.21
DNA structure Figure 2.22

Chapter 3

Ranges of the light, electron, and scanning
probe microscopes Figure 3.3

Cells of the three domains of life

Figure 3.4 18

The important relationship between surface
area and volume Figure 3.5 18

Anatomy of a bacterium Figure 3.6 19

An animal cell Figure 3.9 20

A plant cell Figure 3.10 21

Secretion Figure 3.11 22

The nucleus Figure 3.12 22

The endoplasmic reticulum Figure 3.13 23

The Golgi apparatus Figure 3.14 23

Lysosomes Figure 3.15 24

Peroxisomes Figure 3.16 25

Mitochondria extract energy from food
Figure 3.17 25

Chloroplasts are the sites of photosynthesis
Figure 3.18 26

The endosymbiont theory Figure 3.19 26

Chapter 4

The two faces of membrane phospholipids
Figure 4.2 27

Anatomy of a cell membrane Figure 4.3 28

Diffusion Figure 4.4 28

Osmosis Figure 4.5 28

Diffusion affects cell shape Figure 4.6 29

Aquatic organisms must pump water
Figure 4.7 29

Plant cells keep their shapes by regulating
diffusion Figure 4.8 30

Transport moves substances Figure 4.9 30

The sodium-potassium pump Figure 4.10 31

Cotransport Figure 4.11 31

Endocytosis and Exocytosis Figure 4.12 32

Three types of endocytosis Figure 4.13 32

The cytoskeleton is made of protein rods
and tubules Figure 4.14 33

Microtubules move cells Figure 4.16 33

Muscle acts by protein interactions
Figure 4.17 34

Intermediate filaments in skin Figure 4.18 34

Animal cell connections Figure 4.19 35

Plant cell connections Figure 4.20 36

Cellular adhesion aids in defenses
Figure 4.21 37

Signal transduction Figure 4.22 37

Chapter 5

Energy can take many forms	Figure 5.2
Potential energy and kinetic energy	Figure 5.5
Metabolic pathways	Figure 5.8
Anabolism versus catabolism	Figure 5.9
Endergonic and exergonic reactions	Figure 5.10
Chemical equilibrium	Figure 5.11
ATP breakdown and formation link biochemical reactions	Figure 5.12
NADH carries electrons	Figure 5.13
Electron transport chains	Figure 5.14
Enzymes lower the activation energy	Figure 5.15
Enzymes are specific	Figure 5.16
Negative feedback (feedback inhibition)	Figure 5.17

Chapter 6

Oxygen changed the living world	Figure 6.2
The electromagnetic spectrum	Figure 6.3
Leaf color	Figure 6.4
Chlorophyll	Figure 6.5
Other photosynthetic pigments	Figure 6.6
Chloroplasts	Figure 6.7
Collecting light energy	Figure 6.8
Overview of photosynthesis	Figure 6.9
The light reactions of photosynthesis	Figure 6.10
Chemiosmotic phosphorylation	Figure 6.11
Carbon fixation	Figure 6.12
C ₄ photosynthesis	Figure 6.13
Different environments call for different approaches to photosynthesis	Figure 6.14

Chapter 7

All cells undergo glycolysis	Figure 7.2
An overview of cellular respiration	Figure 7.3
Cellular respiration occurs in mitochondria	Figure 7.4
Glycolysis	Figure 7.5
Transition to the mitochondria	Figure 7.6
Products of the Krebs cycle	Figure 7.7
The electron transport chain of the mitochondria	Figure 7.9
Two views of ATP synthase	Figure 7.10
Negative feedback regulates aerobic respiration	Figure 7.11
How nutrients enter the energy pathways	Figure 7.12
Fermentation	Figure 7.13
Energy yield of respiration	Figure 7.14
The energy pathways and cycles connect life	Figure 7.15

Chapter 8

Cell division and apoptosis regulate development	Figure 8.1
The cell cycle	Figure 8.2
Cloning mammals requires cell cycle synchronization	Figure 8.3
Replicated and unreplicated chromosomes	Figure 8.4
The spindle aligns chromosomes	Figure 8.5
Steps of mitosis	Figure 8.7
Cytokinesis begins as the chromosomes separate	Figure 8.8
Cytokinesis in plants	Figure 8.9
Cell cycle control	Figure 8.10
Telomeres	Figure 8.11
Contact inhibition	Figure 8.12
Cyclins and kinases pair to regulate the cell cycle	Figure 8.13
Stem cells	Figure 8.14
Apoptosis carves toes	Figure 8.15
Death of a cell	Figure 8.16
Cancers take many years to spread	Figure 8.17

Chapter 9

Sexual reproduction	Figure 9.2
Reproduction in <i>Chlamydomonas</i>	Figure 9.4
A schematic overview of meiosis	Figure 9.6
An overview of meiosis	Figure 9.7
Crossing over recombines genes	Figure 9.8
Independent assortment	Figure 9.9
Differences between mitosis and meiosis	Figure 9.10
Human sperm	Figure 9.12
Sperm formation (spermatogenesis)	Figure 9.13
Meiosis produces sperm cells	Figure 9.14
Ovum formation (oogenesis)	Figure 9.15
The making of oocytes	Figure 9.16
Oogenesis and spermatogenesis in the human compared	Figure 9.17

Chapter 10

Traits Mendel studied	Figure 10.1
Mendel's experimental approach for breeding peas	Figure 10.2
Mendel crossed short and tall pea plants	Figure 10.3
Homologous chromosomes	Figure 10.4
Mendel's first law—gene segregation	Figure 10.5
A Punnett square	Figure 10.6
Carriers and genotypic ratios	Figure 10.8
A pedigree for an autosomal recessive trait	Figure 10.9

A pedigree for an autosomal dominant trait	Figure 10.10
Plotting a dihybrid cross	Figure 10.11
Meiosis produces genetic variation	Figure 10.12
The product rule	Figure 10.13
Lethal alleles	Figure 10.14
Pleiotropy	Figure 10.16
Epistasis	Figure 10.17
Incomplete dominance in snapdragon flowers	Figure 10.18
Codominance	Figure 10.19
Skin color follows a polygenic pattern of inheritance	Figure 10.21
Concordance	Figure 10.23

Chapter 11

Anatomy of a chromosome	Figure 11.1
Centromere position is used to distinguish chromosomes	Figure 11.2
Expected results of a dihybrid cross	Figure 11.3
Crossing over	Figure 11.4
Allele configuration is important	Figure 11.5
Breaking linkage	Figure 11.6
Environment affects sex determination	Figure 11.7
Sex determination in humans	Figure 11.9
Hemophilia A	Figure 11.10
X inactivation	Figure 11.11
Extra and missing chromosomes—aneuploidy	Figure 11.13
Trisomy 21 Down syndrome	Figure 11.14
Chromosomal mistakes	Figure 11.15
A reciprocal translocation	Figure 11.16
Fragile X syndrome	Figure 11.17

Chapter 12

Discovery of a “transforming principle”	Figure 12.2
DNA is the “transforming principle”	Figure 12.3
A virus (bacteriophage) infects a bacterium	Figure 12.4
Hershey-Chase experiment	Figure 12.5
Different ways to represent the DNA double helix	Figure 12.7
DNA bases	Figure 12.8
DNA base pairs	Figure 12.9
DNA strands are antiparallel	Figure 12.10
DNA is highly condensed in eukaryotic cells	Figure 12.11
DNA replication is semiconservative	Figure 12.12
Overview of DNA replication	Figure 12.14
DNA replication takes many steps	Figure 12.15
Two types of DNA repair	Figure 12.16

Chapter 13

DNA to RNA to protein	Figure 13.1	108
DNA and RNA differ functionally and structurally	Figure 13.2	108
The lactose operon	Figure 13.3	109
Binding to DNA	Figure 13.4	109
Transcription begins	Figure 13.5	110
The relationship among RNA, the DNA template strand, and the DNA coding strand	Figure 13.6	110
Transcription of RNA from DNA	Figure 13.7	111
The ribosome	Figure 13.8	111
Transfer RNA	Figure 13.9	112
Messenger RNA processing—the maturing of the message	Figure 13.10	112
From DNA to RNA to protein	Figure 13.11	113
Three at a time	Figure 13.12	113
The genetic code does not overlap	Figure 13.13	114
Beginning translation	Figure 13.14	114
Building a polypeptide	Figure 13.15	115
Making multiple copies of a protein	Figure 13.16	116
Sickle cell disease results from a single base change	Figure 13.17	116
Spontaneous mutation	Figure 13.18	117
Gene duplication and deletion	Figure 13.19	117

Chapter 14

Science evolves	Figure 14.1	118
Rock layers reveal Earth history and sometimes life history	Figure 14.2	118
The voyage of the <i>Beagle</i>	Figure 14.3	119
Convergent evolution	Figure 14.4	120
Finch beak shape reflects natural selection	Figure 14.5	120

Chapter 15

Hardy-Weinberg equilibrium—an idealized state when evolution does not occur	Figure 15.1	121
The founder effect	Figure 15.2	122
The bottleneck effect	Figure 15.3	122
Types of natural selection	Figure 15.4	122
Balanced polymorphism	Figure 15.5	123
Factors that alter allele frequencies and thereby contribute to evolution	Figure 15.6	124

Chapter 16

Different views of species relationships	Figure 16.2	125
Placing the Platypus	Figure 16.3	125
Separating species	Figure 16.4	126
Allopatric speciation	Figure 16.5	127
Parapatric speciation	Figure 16.6	127

Flycatchers illustrate allopatry and sympatry Figure 16.8	127	An early walk Figure 18.21	148
Plotting evolution Figure 16.9	128	Handy hominid Figure 18.22	148
The pace of evolution—speciation and stasis Figure 16.10	128	Chapter 19	
Adaptive radiation on islands Figure 16.12	128	Tobacco mosaic virus Figure 19.1	149
Adaptive radiation on a global scale Figure 16.13	129	Viruses are small compared to cells Figure 19.3	150
Inbreeding contributes to extinction at the population level Figure 16.14	129	HIV binds to a helper T cell Figure 19.4	151
Catastrophes affect evolution Figure 16.15	130	Viral entry into cells Figure 19.5	152
The world at the time of the Permian extinctions Figure 16.16	130	Plant viruses enter through injury Figure 19.6	152
Chapter 17		A generalized viral replication cycle Figure 19.7	153
Two types of evolutionary tree diagrams Figure 17.2	132	Lysis versus Lysogeny Figure 19.8	153
Constructing a cladogram Figure 17.3	133	Replication of HIV Figure 19.9	154
Fossil distribution yields clues to changing geography Figure 17.5	134	Bats and birds can transport viruses to new hosts Figure 19.10	155
A changing world Figure 17.6	135	Prions change shape Figure 19.12	155
Carbon 14 dating Figure 17.8	136	Chapter 20	
Vertebrate skeletal organization reflects common ancestry Figure 17.9	136	Bacterial cell structure Figure 20.2	156
Comparative anatomy Figure 17.10	137	Gram stain Figure 20.4	157
Homology and Analogy Figure 17.11	138	Prokaryotes can be classified by cell shapes Figure 20.6	158
Humans are very closely related to gorillas and chimpanzees Figure 17.15	138	Prokaryotic cell division Figure 20.9	159
Amino acid sequence similarities are a measure of evolutionary relatedness Figure 17.16	139	Transformation Figure 20.10	159
The degree of DNA hybridization reflects the degree of evolutionary relatedness Figure 17.18	139	Transduction Figure 20.11	160
Chapter 18		Conjugation Figure 20.12	160
A time line of early Earth Figure 18.1	140	Chapter 21	
Chemical evolution Figure 18.2	140	Choanoflagellates resemble choanocytes in sponges Figure 21.1	161
Demonstrating chemical evolution Figure 18.3	141	Life cycle of the cellular slime mold <i>Dictyostelium discoideum</i> Figure 21.7	162
Life in the deep ocean Figure 18.4	141	<i>Euglena</i> Figure 21.8	163
From “soup” to “crepes” Figure 18.5	142	Trypanosomes Figure 21.9	163
A theory of life’s beginnings Figure 18.6	143	Dinoflagellate features Figure 21.20	164
Evolution of metabolic pathways Figure 18.7	144	<i>Plasmodium</i> causes malaria Figure 21.13	164
Precambrian time accounts for five-sixths of Earth’s history Figure 18.8	144	Anatomy of <i>Paramecium</i> Figure 21.14	165
A glimpse of the sequence of appearance of different life-forms on Earth Figure 18.9	145	Reproduction of a green alga, the sea lettuce <i>Ulva</i> Figure 21.10	165
The endosymbiont theory revisited Figure 18.10	145	Diversity of green algae Figure 21.21	166
Plant or animal? Figure 18.13	146	Chapter 22	
From an aquatic to a terrestrial existence Figure 18.16	146	Sexual life cycles Figure 22.1	167
Life in the Mesozoic Figure 18.18	147	Plant diversity Figure 22.2	168
Placental mammals migrated Figure 18.19	148	Diversification of plants after they moved onto dry land Figure 22.3	169
Early hominids Figure 18.20	148	Bryophytes Figure 22.4	170
		Alternation of generations in a bryophyte Figure 22.5	171
		Seedless vascular plants Figure 22.9	172
		Alternation of generations in a fern Figure 22.10	173
		Gymnosperms Figure 22.13	174
		Pine life cycle Figure 22.15	175
		Angiosperms Figure 22.16	176
		Monocots and dicots Figure 22.18	176
		The rise of angiosperms Figure 22.19	177

Chapter 23		
Fungal phyla Figure 23.2	178	
The fungal body Figure 23.5	178	
<i>Pilobolus</i> , the "shotgun fungus" Figure 23.6	179	
Zygomycete reproduction Figure 23.8	180	
Fly killer Figure 23.9	181	
Ascomycete reproduction Figure 23.11	181	
Reproduction in basidiomycetes Figure 23.13	182	
Anatomy of a lichen Figure 23.15	183	
Chapter 24		
Animal beginnings? Figure 24.1	184	
Animal body forms Figure 24.2	184	
Gastrulation produces embryonic tissue layers Figure 24.3	185	
Protostomes versus deuterostomes Figure 24.4	186	
Body cavities Figure 24.5	186	
Animal classification Figure 24.6	187	
Phylum Porifera Figure 24.7	187	
Sponge anatomy Figure 24.8	188	
Phylum Cnidaria Figure 24.9	188	
Cnidocytes are stinging cells Figure 24.10	189	
Life cycle of <i>Aurelia</i> , a cnidarian that alternates body forms Figure 24.11	190	
Tapeworms Figure 24.13	191	
A planarian flatworm Figure 24.14	192	
Molluscan diversity Figure 24.15	192	
Generalized molluscan body plan Figure 24.16	193	
Annelid diversity Figure 24.17	193	
Anatomy of an earthworm Figure 24.18	194	
Roundworms Figure 24.20	194	
The arthropods Figure 24.21	195	
Mandibulate arthropods Figure 24.23	196	
Echinoderm characteristics Figure 24.24	197	
Chapter 25		
A tree depiction of the types of chordates Figure 25.1	198	
A chordate has four defining characteristics Figure 25.2	198	
Tunicates Figure 25.3	199	
Lancelets Figure 25.4	200	
Common ancestry of humans with other vertebrates Figure 25.5	201	
The jawless fishes Figure 25.6	202	
Development of jaws Figure 25.7	203	
The cartilaginous fishes Figure 25.8	204	
Built to swim Figure 25.9	205	
The bony fishes Figure 25.10	205	
Fins become legs Figure 25.11	206	
Amphibian diversity Figure 25.12	206	
Phylogenetic relationships of the tetrapods Figure 25.13	207	
Reptilian diversity Figure 25.14	208	
The amniote egg Figure 25.15	209	
The relationship of birds to other chordates Figure 25.16	209	
Birds' beaks are related to their functions Figure 25.17	210	
Adaptations for flight Figure 25.18	210	
Feather form and function Figure 25.19	211	
Mammalian diversity Figure 25.20	212	
The extant orders of mammalia Figure 25.21	213	
Primate diversity Figure 25.22	213	
Chapter 26		
Parts of a flowering plant Figure 26.1	214	
Primary growth of a dicot's shoot Figure 26.2	215	
Opening and closing of stomata Figure 26.5	215	
Two types of xylem cells Figure 26.6	216	
Phloem cells Figure 26.7	216	
Stem anatomy Figure 26.8	217	
Anatomy of a leaf Figure 26.12	218	
Leaf abscission Figure 26.13	219	
Two main patterns of root organization Figure 26.14	219	
Anatomy of a primary root Figure 26.15	220	
Root hairs Figure 26.16	221	
The Casparian strip Figure 26.17	221	
Secondary growth produces wood Figure 26.19	222	
Anatomy of a secondary stem Figure 26.20	222	
Monocots and dicots compared Figure 26.21	223	
Chapter 27		
Plant transport systems Figure 27.1	224	
Essential nutrients for plants Figure 27.2	225	
Bacteria provide usable nitrogen to plants Figure 27.5	225	
Water and dissolved minerals are pulled to treetops Figure 27.6	226	
A column of fluid rises higher in a thin tube than in a wider one Figure 27.7	227	
Two routes into roots Figure 27.8	227	
Aphids reveal sieve tube pressure Figure 27.9	228	
Photosynthate moves under pressure from a source to a sink Figure 27.10	228	
Chapter 28		
Alternation of generations in flowering plants Figure 28.2	229	
Parts of a flower Figure 28.3	229	
Major steps in the life cycle of a flowering plant Figure 28.4	230	
Sperm and egg formation in a flowering plant Figure 28.5	231	

Double fertilization	Figure 28.9	232	Overview of the human nervous system	258
A seed houses an embryo	Figure 28.10	233	Figure 31.14	259
Fruit parts derive from flower parts	Figure 28.11	234	A reflex arc	259
Seeds yield new plants	Figure 28.13	235	The human brain	260
			Cerebral specialization	260
			Somatosensory and motor cortex	260
			Figure 31.18	261
			The Autonomic nervous system	261
			Figure 31.19	262
Chapter 29			Chapter 32	
Plants bend toward light	Figure 29.1	236	Sensory information flow	262
Auxins promote cell lengthening	Figure 29.2	236	Receptor potentials trigger action potentials	262
Apical dominance	Figure 29.4	237	Figure 32.3	263
Gravity influences plant growth	Figure 29.7	237	How odorant molecules signal the brain	263
A clinostat	Figure 29.8	238	Figure 32.5	263
Flowering responses to day length	Figure 29.12	238	Taste	264
Night-time light flashes inhibit flowering in short-day plants	Figure 29.13	239	Invertebrate eyes	264
The blue pigment phytochrome comes in two forms	Figure 29.14	239	Anatomy of the vertebrate eye	265
The last flash matters	Figure 29.15	240	Figure 32.8	266
Experiments reveal that blue light controls heliotropism through auxin	Figure 29.19	241	Correcting vision	266
			The visual pathway	267
			From the eyes to the brain	267
			Anatomy of the ear	268
			Hearing	268
			Correspondence between cochlea and cortex	268
			Figure 32.14	269
			Equilibrium and balance	270
			Touch	270
Chapter 30			Chapter 33	
Types of epithelium	Figure 30.1	242	Chemical messenger systems are based on molecular recognition	271
Types of connective tissue	Figure 30.2	243	Exocrine versus endocrine glands	271
Nervous tissue	Figure 30.3	244	Figure 33.2	272
Human tissue types	Figure 30.4	245	Two types of hormones	272
Human organ systems	Figure 30.5	246	Feedback loops regulate hormone action	272
Negative feedback systems promote homeostasis	Figure 30.6	247	Figure 33.4	273
Human skin	Figure 30.8	248	The pancreas regulates blood glucose level	273
Structure of hair and follicle	Figure 30.9	249	Figure 33.5	274
Integumentary specializations	Figure 30.10	250	Metamorphosis	274
Shark skin	Figure 30.11	250	Endocrine system control	275
			Figure 33.8	276
			Control of thyroid gland function	277
			Figure 33.10	278
			Regulation of blood calcium level	279
			Figure 33.11	279
			The adrenal glands	279
			Figure 33.12	280
			The pancreas	280
			Figure 33.13	281
			Diabetes and hypoglycemia	281
			Control of reproductive hormones	281
			Figure 33.15	281
Chapter 31			Chapter 34	
Nervous systems in action	Figure 31.1	251	Earthworm locomotion	280
Parts of a neuron	Figure 31.2	251	Endoskeleton diversity	280
Categories of neurons	Figure 31.3	252	The human skeleton	281
The resting potential	Figure 31.4	252		
The generation of an action potential	Figure 31.5	253		
Myelin sheaths encase many axons	Figure 31.6	254		
Saltatory conduction	Figure 31.7	254		
Transmission across a synapse	Figure 31.8	255		
Anatomy of an antidepressant	Figure 31.9	255		
Invertebrate nervous systems	Figure 31.11	256		
Figure 31.11				
Hierarchical organization of the vertebrate nervous system	Figure 31.12	256		
Vertebrate brains	Figure 31.13	257		

The structure of a long bone	Figure 34.8	282
Antagonistic muscles	Figure 34.9	282
Three types of muscle cells and tissues	Figure 34.10	283
The human muscular system	Figure 34.11	284
Skeletal muscle organization	Figure 34.12	285
Anatomy of a muscle fiber	Figure 34.13	285
The sliding filament model of muscle contraction	Figure 34.14	286
How a muscle moves	Figure 34.15	287
A neuromuscular junction	Figure 34.16	288
Motor units	Figure 34.17	288
The synovial joint—where bone meets bone	Figure 34.18	289
Bones, joints, and muscles work together as lever systems	Figure 34.20	289

Chapter 35

Open and closed circulatory systems	Figure 35.1	290
Vertebrate circulatory diversity	Figure 35.2	290
The journey of blood in the human circulatory system	Figure 35.3	291
Human circulatory system	Figure 35.4	292
A human heart	Figure 35.5	293
Electrical activity in the heart	Figure 35.6	293
Types of blood vessels	Figure 35.7	294
Capillaries	Figure 35.8	295
Valves in veins help return blood to the heart	Figure 35.9	296
Blood pressure	Figure 35.10	296
Blood pressure in vessels	Figure 35.11	297
Blood composition	Figure 35.13	297
Blood clotting	Figure 35.14	298
Human lymphatic system	Figure 35.15	299
Lymph vessels and lymph nodes	Figure 35.16	299

Chapter 36

Diversity in respiratory surfaces	Figure 36.2	300
Insect tracheal systems	Figure 36.3	300
Gills	Figure 36.4	301
The evolution of lungs	Figure 36.5	301
Respiration in frogs	Figure 36.6	302
Respiration in birds	Figure 36.7	302
The human respiratory system	Figure 36.8	303
The lining of the upper respiratory tract is adapted to expel particles	Figure 36.9	304
Alveoli	Figure 36.11	304
How we breathe	Figure 36.12	305
Oxygen and carbon dioxide are exchanged	Figure 36.13	306
Breathing control	Figure 36.14	306

Chapter 37

Intracellular and extracellular digestion	Figure 37.2	307
One-opening and two-opening digestive systems	Figure 37.3	307
Digestion in a bird	Figure 37.4	308
Digestive systems are adapted to an animal's diet	Figure 37.5	309
The human digestive system	Figure 37.6	310
Muscles move food	Figure 37.7	311
Anatomy of a tooth	Figure 37.8	311
Separating air from food	Figure 37.9	311
The stomach	Figure 37.10	312
Overview of chemical digestion	Figure 37.11	313
The lining of the small intestine	Figure 37.12	314
The large intestine	Figure 37.13	314
Food's journey through the human digestive tract	Figure 37.14	315
Accessory structures	Figure 37.15	315
One healthful diet	Figure 37.16	316

Chapter 38

Ectothermy and endothermy	Figure 38.1	317
Countercurrent heat exchange	Figure 38.2	317
The carotid rete	Figure 38.4	318
Thermoregulation in humans	Figure 38.5	318
Osmoregulation in fishes	Figure 38.7	319
Water gain and loss in a kangaroo rat and a human	Figure 38.9	319
The flame cell system of a planarian	Figure 38.10	319
Earthworm nephridia	Figure 38.11	320
Excretion in insects	Figure 38.12	320
Human urinary system	Figure 38.13	321
Anatomy of a kidney	Figure 38.14	321
Overview of urine formation in the nephron	Figure 38.15	322
The glomerulus and glomerular capsule	Figure 38.16	322
Activities along a nephron	Figure 38.17	323
Negative feedback control of osmotic concentration	Figure 38.18	324

Chapter 39

Responding to injury	Figure 39.1	325
Levels of immune protection	Figure 39.2	325
The evolution of immunity	Figure 39.3	326
Inflammation	Figure 39.4	326
Complement kills bacteria	Figure 39.6	327
Immune cells are diverse	Figure 39.7	327
Macrophages are antigen-presenting cells	Figure 39.8	328
Production of antibodies	Figure 39.9	329
An immune response recognizes many targets	Figure 39.10	330

Antibody structure	Figure 39.11	330	Logistic growth	Figure 42.8	356
Classes of antibodies	Figure 39.12	331	Expanding moose populations	Figure 42.9	356
T cells are the heart of an immune response	Figure 39.13	331	Boom and bust cycles	Figure 42.10	356
Death of a cancer cell	Figure 39.14	332	The human population is growing exponentially	Figure 42.11	357
Rh incompatibility	Figure 39.15	332	Regional trends in future population growth	Figure 42.12	358
How HIV decimates T cell populations	Figure 39.16	333			
Allergy	Figure 39.17	334			
Chapter 40			Chapter 43		
Human sperm	Figure 40.1	335	Fundamental and realized niches	Figure 43.2	359
Embryonic resemblances	Figure 40.2	336	Populations coexist by reducing competition	Figure 43.4	359
Spemann's primary organizer	Figure 40.4	337	Primary succession can yield a deciduous forest after centuries	Figure 43.7	360
Gurdon's experiment	Figure 40.5	338	The Antarctic web of life	Figure 43.10	361
The human male reproductive system	Figure 40.6	339	Energy flow through an ecosystem	Figure 43.11	362
The human female reproductive system	Figure 40.7	340	Pyramids by numbers	Figure 43.12	362
Three types of biological changes make up the menstrual cycle	Figure 40.8	341	The water cycle	Figure 43.13	363
Fertilization	Figure 40.9	342	The carbon cycle	Figure 43.14	364
From ovulation to implantation	Figure 40.10	342	The nitrogen cycle	Figure 43.15	365
Implantation	Figure 40.11	343	The phosphorus cycle	Figure 43.16	366
Neurulation	Figure 40.12	343	Biomagnification in a sampling of wetland organisms	Figure 43.18	367
Early embryos	Figure 40.13	343			
The placenta	Figure 40.14	344	Chapter 44		
Sexual development	Figure 40.15	345	Latitude and altitude influence plant communities	Figure 44.1	368
Labor	Figure 40.16	346	Earth's seasons	Figure 44.2	368
Life stages	Figure 40.17	347	Patterns of air circulation and moisture	Figure 44.3	369
Chapter 41			Earth's major biomes	Figure 44.4	369
Fixed action patterns	Figure 41.3	348	The tropical rain forest	Figure 44.5	370
Releasers elicit specific behaviors	Figure 41.4	348	Tropical dry forest	Figure 44.6	370
Bird migrations	Figure 41.8	349	Tropical savanna	Figure 44.7	370
Fatherhood assured	Figure 41.14	349	Desert	Figure 44.8	370
Zebra social structure reflects habitat	Figure 41.17	350	Temperate grassland	Figure 44.10	371
Chemical cues are important in lobster mating	Figure 41.18	351	Temperate forests	Figure 44.11	371
Bee dances	Figure 41.20	352	Taiga	Figure 44.12	371
Chapter 42			Tundra	Figure 44.13	371
Population dispersion is a basic feature of populations	Figure 42.1	353	Zones of a lake	Figure 44.14	372
Fire ant range	Figure 42.2	353	Rivers change along their course	Figure 44.15	373
Early reproduction leads to fast population growth	Figure 42.3	354	Zones of the ocean	Figure 44.17	373
Survivorship curves show extremes among species	Figure 42.4	354			
Population age structures predict the future	Figure 42.5	355	Chapter 45		
Exponential population growth	Figure 42.6	355	Acid deposition	Figure 45.3	374
A population explosion and crash	Figure 42.7	355	The ozone hole and ultraviolet radiation	Figure 45.4	374
			The greenhouse effect	Figure 45.5	374
			CO ₂ level and global average temperature are correlated	Figure 45.6	375
			Temperate deforestation in the United States	Figure 45.8	375
			A desert spreads	Figure 45.9	376
