

Preface to the Series

This series was planned to present a number of introductory articles showing the clear advantages which may be obtained by attacking biochemical and biological problems using electrochemical techniques and theories, and also to illustrate the high desirability of a constructive collaboration between electrochemists and biochemists. In order to attain these aims, the articles were written, in a somewhat pedagogical form, obviously at high level, by authoritative electrochemists for the particular benefit of biochemists and biologists, and by authoritative biochemists and biologists for the particular benefit of electrochemists. The chapters will be compiled as monographs and will vary considerably in the approach to the different subjects, in the development of the topics and in their length; however, they will all possess the characteristic of clarity in order to be easily understandable by scholars having originally a different background. The coverage in a number of volumes will be quite comprehensive.

Suggestions for new topics will be welcomed and highly appreciated.
