

Acknowledgments

WE EXTEND deep thanks to the many people who helped us produce this volume. First, we are grateful to Winfried Lampert, who suggested the idea of an edited book on inducible defenses. We appreciate the interest of the many colleagues at the Inducible Defense Symposium in Plön (1995) who gave freely of ideas and inspiration for this project and to the European Science Foundation for funding this special session. We are especially grateful to Simon Levin of Princeton University for his initial enthusiasm for publishing our book with Princeton University Press and for his ongoing support. We called on the services of a large number of external reviewers, and to them we extend a warm thank you. Members of our lab groups often helped with reviewing or discussion on short notice; particular thanks for this work goes to Kiho Kim, Andrea Graham, Erika Iyengar, and Wilfried Gabriel. The Graduate Core course at Cornell was also generous in critiquing sections of the book, and we appreciate the students' help. Finally, we are especially grateful to Bob Paine and an anonymous reviewer for reviewing the book in its entirety and providing useful suggestions for improvement. We are grateful also to the National Science Foundation Program in Ecological Physiology, which supported Harvell's research and also some of the time she devoted to this book; to the Section of Ecology and Systematics at Cornell University for providing some secretarial time; to the Ecology Department at the Ludwig-Maximilians-Universität Munich for support; and to Rosie Brainard for her help with countless details of correspondence. We appreciate the help from the staff at Princeton University Press, in particular Alice Calaprice, Sam Elworthy, and Emily Wilkinson. Last but not least, we thank all the contributors for their cooperation and for their patience in putting up with the editors' countless demands and unending deadlines.
