

Preface

This short book came into being following a few courses I gave on receptors at the Hebrew University of Jerusalem, the Weizmann Institute of Science, and some summer schools in Europe. I realized that important fundamental concepts and methodological aspects of receptor research are not easily available, widely scattered as they are throughout the literature. I therefore decided to put what I believe are fundamental quantitative aspects of receptor research into one relatively short book.

Acknowledgments

I wish to thank Prof. Robert Werman from the Department of Neurobiology in our Institute for carefully reading the manuscript and providing me with excellent criticism and valuable suggestions. I also wish to extend my appreciation to Prof. Zvi Selinger from our Department and to Prof. Henry A. Lester from the Division of Biology at Caltech for their important comments and suggestions. Last but not least, I wish to thank Mrs. Edith Dicker for her patience and skill in preparing this book.
