

MATHEMATICAL ECOLOGY, Second Edition

E. C. Pielou

An expanded version of E. C. Pielou's *Introduction to Mathematical Ecology*, this book covers population dynamics and the demography of natural populations, population interactions, ecological model building, ecosystem stability, spatial patterns, and the statistical interpretation of field data. It also discusses ecological maps, mosaics, and zonation patterns, ecological association and segregation, classification and coordination of communities and canonical correlation analysis, and multiple discriminant analysis.

1977 (0 471-01993-3) 384 pp.

SAMPLING DESIGN AND STATISTICAL METHODS FOR ENVIRONMENTAL BIOLOGISTS

Roger H. Green

A compact guide to the principles of sampling design and statistical analysis methods for environmental studies. Arranged in three sections, the book examines principles, including sampling and statistical design, hypothesis formulation, and testing; decisions, providing a key to five broad categories of environmental studies; and sequences, using examples to illustrate the five categories.

1979 (0 471-03901-2) 257 pp.

ELEMENTARY MATHEMATICAL ECOLOGY

John Vandermeer

A working guide to the important mathematical techniques used in the biological sciences. This book uses a simple, problem-solving approach designed to combat "math anxiety" and develop mastery of quantitative ecological principles. Methods include population modeling, survival and growth computations, spatial pattern analysis, competition equations, and species diversity distribution and dynamics.

1981 (0 471-08131-0) 294 pp.
