About This Book

Completely revised, this new edition of a modern classic provides comprehensive coverage of both fundamental and clinical aspects of immunology and cancer biology. The distinguished authors have lucidly synthesized the latest information of this exciting and important field. Using a new, more readable format, they have organized the material into thirteen chapters, including several hundred new figures.

Each chapter contains:

- **CONCEPTS AND EXPLANATION.** The authors present and discuss a carefully developed sequence of 5 to 10 key concepts, with ample use of diagrams, photomicrographs, and tables.
- **SELECTED BIBLIOGRAPHY.** An annotated reference list, organized by topic, guides the reader through the literature.
- **PROBLEMS.** An extensive set of instructive problems is provided. The problems range from simple to difficult, and many of the more challenging ones are based on the current literature.
- **ANSWERS.** Detailed answers to the problems are provided.

This text can be used as the main text for a course in immunology or as a supplement for a course in cell biology, molecular biology, or microbiology. It is also an ideal resource for individual study.
