

PROTEIN BIOCHEMISTRY AND PROTEOMICS

Rehm et. al.'s new entry in the Experimenter series provides you with an insider's overview of the new methods in protein biochemistry and proteomics. You will immediately sense the authors' familiarity with the excitement and frustration of the daily lab challenges. With these tips & tricks, your experiments will stand a much better chance of success.

But this valuable lab handbook is more than just a collection of methods:

- It shows you the way out of experimental dead ends and gives you an instinct for the right experiment at the right time.
- It contains short and precise summaries of routine procedures (e.g. column chromatography, gel electrophoresis) as well as listings of advantages and disadvantages of alternative methods.
- It details the development of ligand binding assays, the production of antibodies, and microsequencing.
- It discusses specialty methods such as solubilization and reconstitution of membrane proteins, analysis of glycoproteins, or determination of the subunits of oligomer proteins.
- It contains an orientation chapter on proteomics.

And, with refreshing candor, like other books in the series, it addresses those 'dark nights of the soul' when you might just be asking yourself why you are doing all of this. Look for other books in this new Elsevier series designed specifically for laboratory directors, managers, and workers.

THE EXPERIMENTER SERIES

Müller and Röder: MICROARRAYS, Elsevier/Academic Press,
(2006, Paperback, @260 pp., 0-12-088543-3)

Mülhardt: MOLECULAR BIOLOGY AND GENOMICS, Elsevier/Academic Press,
(2006, Paperback, @300 pp., 0-12-088546-8)

Luttmann, et. al.: IMMUNOLOGY, Elsevier/Academic Press,
(2006, Paperback, @250 pp., 0-12-088544-1)

Rehm: PROTEIN BIOCHEMISTRY AND PROTEOMICS, Elsevier/Academic Press,
(2006, Paperback, @300 pp., 0-12-088546-8)
