

Ecology: An Australian Perspective is uniquely and wholly Australian. It is the only textbook of ecology that deals comprehensively with the ecological principles and practice of plant and animal ecology in an Australian context.

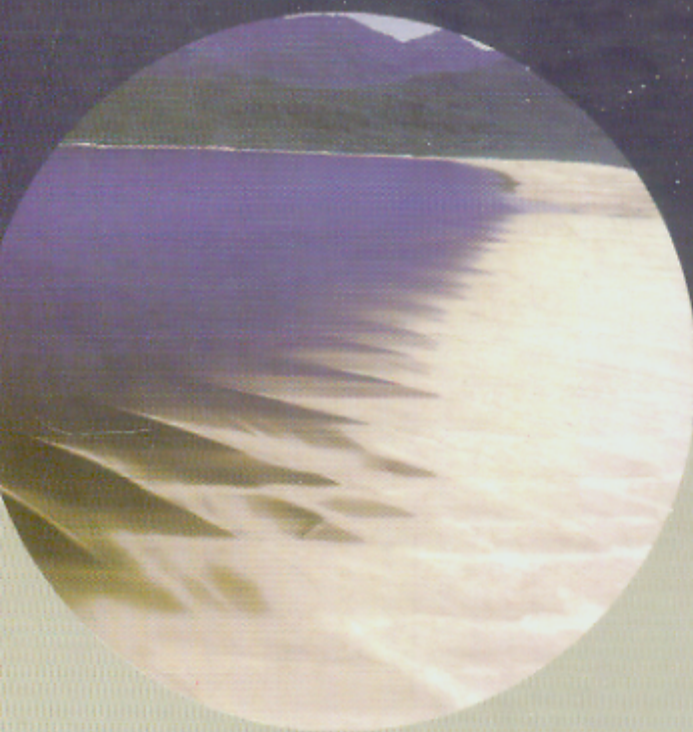

Each of the thirty-four chapters is written by Australian scientists, all with international reputations in their field. This means that *Ecology: An Australian Perspective* has the most up-to-date coverage of ecological principles and their applications to the highly endemic flora and fauna of Australia. This new textbook provides comprehensive introductions to global problems of great significance for Australia, including threats to biodiversity, depletion of the ozone layer, climate change, and El Niño.

Structured so that it will be applicable to courses in plant ecology, animal ecology, conservation and natural resource management, *Ecology: An Australian Perspective* is both the ideal resource for students throughout their undergraduate careers and a starting point for postgraduates and researchers.
