Viral Infections of Humans

Epidemiology and Control

Edited by Alfred S. Evans

Yale University

Viral Infections of Humans offers the most complete coverage to date of common human viral infections. It provides systematic coverage of the epidemiology, pathogenesis, clinical features, and control of nineteen major groups of acute viral infections as well as four chronic conditions exemplified by cancer or chronic viral infections of the central nervous system.

Beginning with an assessment of epidemiological concepts and methods, surveillance, seroepidemiology, and a review of common viral syndromes and their causes, the volume then covers, in alphabetical order, all the major viral groups infecting humans, from arboviruses to varicella-zoster. The final chapters deal with four groups of infections in which a viral etiology is suspected: Burkitt lymphoma; cancer of the nasopharynx; cancer of the cervix; and four chronic infections of the central nervous system — subacute sclerosing panencephalitis, progressive multifocal leukoencephalopathy, Kuru disease, and Creutzfeldt-Jakob disease.
