

Written by renowned historians, philosophers, and biologists—including, among others, Stephen Jay Gould, Diane Paul, John Beatty, Robert Richards, Richard Lewontin, David Sloan Wilson, Peter Bowler, and Richard Dawkins—these essays identify and explicate those terms in evolutionary biology that, though commonly used, are plagued by multiple concurrent and historically varying meanings. Exploring the complexity of keywords and clarifying their role in prominent issues in the field, this book will prove invaluable to scientists and philosophers trying to come to terms with evolutionary theory; it will also serve as a useful guide to future research into the ways in which scientific language works.

---

"This is a book one will turn to again and again... It will be of value to everyone interested in the evolution of life, in the ideas by which we explain that phenomenon, and in the terms by which we recognize those ideas."

—ROBERT RAIKOW, *BioScience*

"Full of insights and small surprises, and thus a delight for browsing as well as deeper reflection."

—WILLIAM C. KIMLER, *Meta Science*

"A fascinating book... which should be required reading for all who teach or write about evolutionary biology."

—*Choice*

"There are few books in the history of science where one can truly say, as one can of this, that a copy should be available in every university and college library."

—JANET BROWNE, *Isis*

"What a splendid idea to have a critical discussion by established experts of the key words used in recent controversies in evolutionary biology. This helps the understanding of these controversies enormously."

—ERNST MAYR
