

LEARN FROM THE CLASSIC TEXT IN ENTOMOLOGY!

Introduction to the Study of Insects has been the standard text for introductory entomology since it was first published in the 1950s by the late Donald Joyce Borror and Dwight Moore DeLong. In this new Seventh Edition, Triplehorn and Johnson combine the taxonomic approach of this text's definitive study of insects with thoroughly updated coverage of insect biology and evolution as well as insect phylogeny.

Through the text's focus on issues of insect systematics and evolution, you'll learn to appreciate the magnitude of the diversity of insect life as well as the immediate and long-term threats to insect diversity. The thorough insect identification keys and extensive accompanying illustrations make the book an invaluable reference for identification of all of the families of insects found in the continental United States and Canada. Triplehorn and Johnson also provide you with information on up-to-date insect collection methods, such as the use of the Global Positioning System.

Charles A. Triplehorn is emeritus faculty at Ohio State University. His research interests include systematics and biogeography of Coleoptera, with research primarily focused on the large family Tenebrionidae (especially those of the Western Hemisphere). Since 1992, he has focused on two particular projects: a revision of the genus *Eleodes*, and of the Neotropical *Diaperini*. Triplehorn is a former president of the American Entomological Society.

Enhance your learning with
FREE access!

InfoTrac® College Edition

Four months of access to **InfoTrac College Edition** is automatically packaged **FREE** with every new copy of this text. This world-class, online university library offers the full text of articles from almost 5,000 scholarly and popular publications, including *Science*, *Scientific American*, *The American Naturalist*, and *Agricultural Research* — updated daily and going back as much as 22 years. In addition, you now also gain instant access to critical thinking and paper writing tools through **InfoWrite**.

FREE access!

Book Companion Web Site
The Brooks/Cole Life Sciences
Resource Center features a rich

array of learning resources, **FREE!** This outstanding site provides you with descriptions of possible degrees and careers in biology as well as a biological game, clip art, and a student feedback site.

Norman F. Johnson is a professor of biology at Ohio State University and curator of the Ohio State University insect collection. His research interests include the systematics of parasitic Hymenoptera and the Proctotrupoidea, with a particular focus to date on the Scelionidae. In 1992 he assumed the position of director of the OSU Insect Collection.
