

Techniques in Ecology & Conservation Series

Edited by William J. Sutherland

In this intensely practical handbook, a team of leading ornithologists describes a wide range of standard methods that can be applied to the study of avian ecology and conservation. Topics covered range from surveys, tracking and handling, breeding biology, foraging behaviour, and migration. Chapters on conservation techniques describe how to assess species over-exploitation, the methods available for the intensive conservation of endangered species, and the principles involved in the maintenance and restoration of habitats. This comprehensive synthesis will be essential reading for graduate students and researchers as well as a valuable resource for environmental consultants and professional conservationists worldwide.

Bird Ecology and Conservation is the first title in a new series of practical handbooks which include titles focusing on specific taxonomic groups as well as those describing broader themes and subjects. The series editor is William J. Sutherland.

The proceeds from this series are being used to send copies to conservationists outside Western Europe, North America, Australia, New Zealand and Japan who would otherwise be unable to use them.
