

Advances in Virus Research—Volume 76

Edited by

John P. Carr and Gad Loebenstein

Cover illustration:

(1) Model of defined and proposed host functions during *Tomato bushy stunt virus* replication (from Nagy and Pogany, this volume).

(2) Cross-protection by a mutant virus lacking a silencing suppressor gene. Wild-type strain Fry Cucumber mosaic virus (Fry-CMV) induces severe symptoms including leaf distortion on tobacco leaves (left). These symptoms were prevented from occurring if plants were previously inoculated with the symptomless mutant, Fry-CMV Δ 2b (right) (from Ziebell and Carr, this volume).

Contents

The Coevolution of Plants and Viruses: Resistance and Pathogenicity
Aurora Fraile and Fernando Garcia-Arenal

Assessment of the Benefits and Risks for Engineered Virus Resistance
Jeremy R. Thompson and Mark Tepfer

Signaling in Induced Resistance
John P. Carr, Mathew G. Lewsey, and Peter Palukaitis

Global Genomics and Proteomics Approaches to Identify Host Factors as Targets to Induce Resistance Against *Tomato Bushy Stunt Virus*
Peter D. Nagy and Judit Pogany

Resistance to Aphid Vectors of Virus Disease
Jack H. Westwood and Mark Stevens

Cross-Protection: A Century of Mystery
Heiko Ziebell and John Peter Carr
